Ver. 1.00 R2
Cessna Instrument Rating Syllabus
Your Path to Becoming an Instrument Rated Pilot

Congratulations!
You now embark on one of the most exciting endeavors—learning to fly through clouds and low
visibility. You will find it challenging and fun, as well as intellectually, physically and emotionally
stimulating. Whether you use an airplane as a tool for business or simply to get above and beyond life
on the ground, you’ll find that the act of piloting an airplane in challenging weather conditions expands
your mind and senses like nothing else you’ve ever experienced.

This syllabus is the guide to your flight training. By following it, you know the objective of every phase of
training and individual flight scenario. It also helps you to understand the topics that you need to study
before you go to the airport.

STEPS FOR BECOMING AN INSTRUMENT RATED PILOT
Earning an instrument rating involves a few specific steps. Your Cessna Pilot Center will explain each
step below in detail.

- Be at least 17 years old (you can start training earlier)
- Possess a valid medical certificate
- Pass a test on aeronautical knowledge (this course prepares you for that test)
- Complete the required flight training for the course
- Pass a practical test

COURSE ELEMENTS
The Cessna online pilot training
- Provides innovative and interactive learning exercises
- Is accessible anywhere you have an Internet connection
- Includes in-airplane videos that can be downloaded for your convenience

The unique design of the training program
- Integrates web-based knowledge sessions with flight scenarios
- Ensures that before every flight you will have the required knowledge to succeed
- Provides flight previews to give you a pilot’s view of what you will practice in the airplane

You and your instructor will discuss the schedule for your training and you will know
- When to complete the appropriate web-based knowledge instruction and flight previews
- What to bring with you for each flight scenario

Upon completion of each flight scenario you and your instructor will
- Review the elements of the flight scenario and the scenario outcome
- Compare your performance to the completion standards
- Independently evaluate the tasks in the flight scenario
- Discuss and compare the results
- Discuss the next flight scenario

Please note that it may take you more than one flight to complete a flight scenario to the established
standards.
COURSE STRUCTURE

The course is divided into four stages. Each stage is divided into two phases.

STAGES
Each stage has a required Progress Check that
• Checks your progress and the effectiveness of your instructor pairing
• Consists of oral quizzing and a flight
• Is given by the Chief Flight Instructor, Assistant Chief Flight Instructor or a designated instructor

The progress checks
• Are nothing to get nervous about; they are to ensure the completeness of your training
  o You will find that flying with another instructor often provides fresh insight and new techniques
• Can be found in
  o Stage 1, Phase 2
  o Stage 2, Phase 4
  o Stage 3, Phase 6
  o Stage 4, Phase 8

PHASES
There are eight phases of training. Each phase has
• Web-based Knowledge Instruction
• Ground Training Checklists
• Flight Scenarios
• Phase Proficiency Checklists

The four stage-ending phases also include
• Progress Check Scenarios
• Progress Check Oral and Flight Checklists
PHASE SEQUENCE
The eight phases are:

1. DEVELOPING INSTRUMENT SKILLS — In this phase you learn preflight preparation for IFR flight, instrument scan techniques, basic instrument flight maneuvers, using the magnetic compass and postflight procedures following an IFR flight.

2. POLISHING INSTRUMENT SKILLS — Here you will polish your skills controlling the airplane by reference only to the flight instruments and learn to receive, copy and fly an IFR clearance. You will also learn to control the airplane simulating failure of the primary flight instruments and recover from an unusual flight attitude.

3. GPS, NDB AND VOR NAVIGATION — This phase provides you the opportunity to develop skills and gain confidence using RNAV, GPS, NDB and VOR avionics systems for IFR navigation. In addition you will learn to apply these skills flying IFR departure procedures.

4. HOLDING PATTERNS AND DME ARCS — This phase introduces holding patterns including their purpose and the requirements for entering, flying and making reports if you have received a holding clearance. You will also learn to fly DME arcs.

5. PRECISION AND NONPRECISION INSTRUMENT APPROACHES — During this phase you will fly both precision and nonprecision approach procedures while learning the visual references needed to make the decision to continue for landing. If the required references are not visible, you will follow the missed approach procedure.

6. AUTOMATION, ATC AND OTHER APPROACHES — In this phase, you’ll polish your skill with precision and nonprecision approaches. You will also discover the value of using the autopilot for instrument approaches. In addition you’ll learn about using a circling maneuver to align with the landing runway.

7. IFR CROSS COUNTRY — Here you learn the steps involved in planning for and flying safe cross countries under Instrument Flight Rules. During a long cross country you will use three different types of IFR approach procedures.

8. PRACTICAL TEST PREPARATION— In this phase you will polish all the instrument flying skills and knowledge you have learned to meet or exceed the Instrument Rating Airman Certification Standards.

Web-based Knowledge Instruction
- Forms your knowledge foundation for the flight scenarios
- Is to be completed before the corresponding phase can be considered complete

Ground Training Checklists
- Can be prepared for by studying the web-based curriculum, flight previews and course library materials
  - Including FAA publications such as the Instrument Flying Handbook, Instrument Procedures Handbook, and FAR/AIM
- Includes items that
  - Can be recorded as ‘Instruction Given’, ‘Describe’ or ‘Explain’
  - Must be demonstrated to the ‘Explain’ level to complete the phase
    - ‘Instruction Given’ indicates that your instructor briefed you on the subject
    - ‘Describe’ indicates that you are able to describe the physical characteristics of the maneuver or knowledge area
    - ‘Explain’ indicates that you are able to describe the task or knowledge area and understand the underlying concepts, principles and procedures
Flight Scenarios
- Provide the objective, structure and real-world simulation for the training flights
- Are designed to help complete the phase training standards
- Can be customized by your Cessna Pilot Center to/for your local training environment
- May be completed out of phase or stage (if approved) as necessary

Phase Proficiency Checklists
- Contain completion standards for the phase, including
  - Flight related tasks that are to be completed to the ‘Perform’ level
  - Single-pilot Resource Management (SRM) items to be completed to the ‘Manage/Decide’ level

WHAT TO EXPECT BEFORE AND AFTER EACH FLIGHT

PREFLIGHT BRIEFING
Before each flight scenario you and your instructor will review the scenario objectives to make sure you both understand what you will be doing during the lesson including any uncompleted tasks from a previous scenario.
- Use this opportunity to ask any questions
- Make sure you understand what is expected of you

POSTFLIGHT DISCUSSION AND EVALUATION
After each flight, you and your instructor will
- Review your flight and evaluate your performance independently
- Compare and discuss your assessment with his or her evaluation

Your instructor will make recommendations to help you in your learning. Make sure you ask questions about any area that is not clear.

You will then complete your flight training record based on the completion standards for the phase. Any tasks requiring additional practice to meet the phase completion standards will be carried over to the next flight scenario.

You may expect at least 15 minutes of preflight briefing and 15 minutes of postflight discussion and evaluation for each scenario.

PROGRESSING THROUGH THE SYLLABUS

HOW TO COMPLETE A PHASE
You have completed a phase when you have achieved 100% progress for that phase in your home study course, all Ground Training Checklist items evaluated as ‘Explain’ and all maneuver and SRM tasks on the Phase Proficiency Checklist are evaluated at the ‘Perform’ or ‘Manage/Decide’ level as appropriate for the completion standards.

You do not need to complete all scenarios in a phase in order to complete that particular phase.
- The scenarios are simply suggested flights to get you to the ‘Perform’ and ‘Manage/Decide’ level for the tasks and standards listed in that particular Phase Proficiency Checklist

It is more common to repeat scenarios to obtain the desired level of proficiency than to skip them.

If you are able meet all of the phase standards and skip a scenario
- You and your instructor must make sure that you meet the hourly training requirements required for an Instrument Pilot Rating according to the Federal Aviation Regulations (FARs)
  - It is possible that you could finish up the course and have to make up time at the end

The flight scenarios in a phase are designed to progress in a building-block approach from lower to higher levels of task and SRM complexity.
- When appropriate, scenarios may be flown out of order within a phase (i.e. equipment, facilities, or weather impacting the next scenario in sequence)
It is recommended that you only fly scenarios that are in the current phase of training you are in.

- However, with the approval of your Chief or Assistant Chief Instructor, you can complete scenarios that are out of the phase you are currently in.

**INTEGRATING AVIATION TRAINING DEVICES INTO THE COURSE**

It is highly recommended that aviation training devices be used to familiarize you to new concepts and techniques whenever possible.

This syllabus is designed for integrated use with a wide variety of aviation training devices (ATDs), which include basic aviation training devices (BATDs) and advanced aviation training devices (AATDs).

Any scenario labeled with "**ATD MAY BE USED**" may be performed in an aviation training device. You will want to be aware that if all scenarios so labeled were flown in an aviation training device (ATD), you will most likely exceed the maximum number of ATD hours that may be credited toward the total course requirements. Note that the permitted ATD hours are different depending on whether you’re enrolled in a Part 141 or a Part 61 curriculum. You and your instructor will want to make sure that you meet the in-the-airplane training requirements (see Appendix A) before you complete the course.

**OVERALL SYSTEM USE**

The Cessna Instrument Pilot training system is designed to provide the most benefit when:

- The instructor assigns preparation for the next scenario (normally in sequence) including
  - Web-based study, suggested study materials, scenario planning
- Prior to the next scenario, you
  - Study the assigned materials
  - Print a Phase Progress Report for your training records at the airport
  - Perform the necessary scenario planning
- Prior to the flight, the instructor may print your training objective for that day including the
  - Flight Scenario
  - Phase Ground Training Checklist and Proficiency Checklist
- During the preflight briefing
  - Your instructor will
    - Review the Phase Progress Report you provide
    - May introduce or evaluate the items on the phase Ground Training Checklist
  - You will
    - Ask any questions you may have
- During the postflight briefing
  - You independently grade the applicable tasks on the Phase Proficiency Checklist
  - Your instructor independently grades the tasks on the Phase Proficiency Checklist
  - You then both discuss the scenario outcome and compare grading
  - The instructor logs the scenario into the Course Tracking Application (CTA) at your Cessna Pilot Center

**FAA INDUSTRY TRAINING STANDARDS (FITS)**

This flight training syllabus for Cessna Pilot Center customers uses the concepts developed under the FAA Industry Training Standards (FITS) program. FITS incorporates three tenets:

- Scenario-based training (SBT)
- Single-pilot resource management (SRM)
- Learner-centered grading (LCG)

**Scenario-Based Training (SBT)** uses real-world scenarios as the foundation of training. Flight maneuvers are still a vital part of flight training, but the use of real-world scenarios help to develop a pilot’s decision making skills. The training presents situations and circumstances that pilots face every day as learning experiences.

**Single-Pilot Resource Management (SRM)** includes the concepts of aeronautical decision making (ADM), risk management (RM), task management (TM), automation management (AM), controlled
flight into terrain (CFIT) awareness, and situational awareness (SA). SRM training helps the pilot to accurately assess and manage risk, thereby making logical and timely decisions.

**Learner-Centered Grading (LCG)** includes two parts: learner self assessment and a detailed debrief by the instructor. The purpose of the self assessment is to stimulate growth in the learner’s thought processes and, in turn, behaviors. The self assessment is followed by an in-depth discussion between the instructor and the customer (pilot in training) that compares the instructor’s assessment to the customer’s self assessment.

**SCENARIO-BASED TRAINING**

The scenario-based approach to training pilots emphasizes the development of critical thinking and flight management skills, rather than focusing solely on traditional maneuver-based skills. The goal of this training philosophy is the accelerated acquisition of higher-level decision making skills. Such skills are necessary to prevent pilot-induced accidents.

Scenario-based training goals include the development of

- Critical thinking skills
- Aeronautical decision-making skills
- Situational awareness
- Pattern recognition (emergency procedures) and judgment skills
- Automation competence
- Planning and execution skills
- Procedural knowledge
- Psychomotor (hand-eye coordination) skills
- Risk management skills
- Task management skills
- Automation management skills
- Controlled flight into terrain (CFIT) awareness

For scenario-based training to be effective there must be a purpose for the flight and consequences if the flight is not completed as planned.

It is vital that you, the pilot in training, and the instructor communicate the following information well in advance of every training flight:

- Purpose of the flight
- Pressures to complete the flight (real or simulated)
- Risks/hazards associated with the scenario (real or simulated)
- Scenario destination(s)
- Desired outcomes
- Possible in-flight scenario changes or deviations (during later stages of the program)

With the guidance of your instructor, you should plan and fly the scenario as realistic as possible. This means that you will know where you are going and what will transpire during the flight. While the actual flight may deviate from the original plan, this method allows you to be placed in a realistic scenario.

**SCENARIO PLANNING**

Prior to the flight, you will be briefed on the scenario to be planned. You will plan the scenario; your instructor will help you the first few times. The flight scenario should include

- Simulated real-world reason to go flying
- Route, including the
  - Destination(s), weather, and applicable NOTAMs
- Pressures to complete the flight (real or simulated)
- Risks associated with the scenario (real or simulated)
- Possible deviations
Reality is the ultimate learning situation, and scenario-based training attempts to get as close as possible to this ideal. The more realistic the training scenario
- The better core safety habits are learned, and
- Decision-making skills can be applied in the real world

**SINGLE-PILOT RESOURCE MANAGEMENT (SRM)**

Single-pilot resource management (SRM) is defined as the art and science of managing all the resources (both onboard the aircraft and from outside sources) available to a pilot flying in a single-pilot operation (prior to and during flight) to ensure that the successful outcome of the flight is never in doubt. SRM will be employed throughout this curriculum.

SRM includes the concepts of
- Task management (TM)
- Automation management (AM)
- Risk management (RM)
- Aeronautical decision making (ADM)
- Situational awareness (SA)
- Controlled flight into terrain (CFIT) awareness

SRM training helps a pilot maintain situational awareness by
- Managing the technology in the aircraft as well as aircraft control and navigation tasks
- Enabling the pilot to accurately assess and manage risk while making accurate and timely decisions
- Helping pilots learn how to gather information, analyze it and make decisions

In most flight scenarios, there is no one correct answer. Pilots are expected to analyze each situation in light of their
- Experience level
- Personal minimums
- Current physical and mental condition
- Ability to make their own decisions as best as possible

Below are standards for each training concept of SRM:

<table>
<thead>
<tr>
<th><strong>Performance</strong></th>
<th><strong>Standards</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>The training task is:</strong></td>
<td><strong>You will:</strong></td>
</tr>
<tr>
<td>Task management (TM)</td>
<td>Prioritize and select the most appropriate tasks (or series of tasks) to ensure successful completion of the training scenario.</td>
</tr>
<tr>
<td>Automation management (AM)</td>
<td>Program and utilize the most appropriate and useful modes of cockpit automation to ensure successful completion of the training scenario.</td>
</tr>
<tr>
<td>Risk management (RM)</td>
<td>Utilize risk management tools to assess and mitigate risk associated with the planned flight both during the preflight planning and in flight.</td>
</tr>
<tr>
<td>Aeronautical decision making (ADM)</td>
<td>Consistently make informed decisions in a timely manner based on the task at hand and a thorough knowledge and use of all available resources.</td>
</tr>
<tr>
<td>Situational Awareness (SA)</td>
<td>Be aware of all factors such as traffic, weather, fuel state, aircraft mechanical condition, and pilot fatigue level that may have an impact on the successful completion of the training.</td>
</tr>
</tbody>
</table>
Controlled Flight Into Terrain (CFIT) Awareness

Understand, describe, and apply techniques to avoid CFIT encounters during system and navigational failures and physiological incidents during IFR flight.

LEARNER-CENTERED GRADING

Learner-centered grading includes two parts

- Learner self assessment
- A detailed debrief by the instructor

The purpose of the self assessment is to stimulate growth in the learner’s thought processes and, in turn, behaviors. The self assessment is followed by an in-depth discussion between you and your flight instructor that compares your self assessment to the instructor’s assessment.

Pre- and postflight briefings are essential for setting goals and assessing if the goals were achieved. During events and tasks that require high levels of attention, there may be little time for learning as the bulk of your cognitive resources are given to performing the actual task.

INDEPENDENTLY GRADING THE SCENARIO

After the scenario is complete, you and your instructor will independently grade your performance for maneuvers and single-pilot resource management (SRM). Note that any grade that would not apply to the task has been grayed out in this syllabus.

It is very important that enough time is allowed. Simply assigning grades and signing logbooks within a limited period of time will not work with this grading system.

After independently evaluating the actual scenario outcomes compared to the desired outcomes

- You and your instructor come together to compare and discuss your individual evaluations during the postflight discussion

You and your instructor may disagree on the evaluations

- This should be used as an opportunity to discuss the scenario further
- The instructor has the ultimate authority in assigning the final grade for the desired outcomes

MANEUVER (TASK) GRADES

**Describe** – At the completion of the ground training session, the pilot in training will be able to describe the physical characteristics of the task at a rote level.

**Explain** – At the completion of the ground training session, the pilot in training will be able to describe the task and display an understanding of the underlying concepts, principles, and procedures.

**Practice** – At the completion of the scenario the pilot in training will be able to plan and execute the scenario. Coaching, instruction, and/or assistance from the instructor will correct deviations and errors identified by the instructor.

**Perform** – At the completion of the scenario, the pilot in training will be able to perform the activity without assistance from the instructor. Errors and deviations will be identified and corrected by the pilot in training in an expeditious manner. At no time will the successful completion of the activity be in doubt.

**Not Observed** – Used if an event is not accomplished or required in the scenario.

SINGLE-PILOT RESOURCE MANAGEMENT (SRM) GRADES

**Explain** – At the completion of the ground training session, the pilot in training can verbally identify the risks inherent in the flight scenario.
**Practice** – The pilot in training can identify, describe, and understand the risks inherent in the scenario. The pilot in training may need to be prompted to identify risks and make decisions.

**Manage/Decide** - The pilot in training can correctly gather the most important data available both within and outside the cockpit, identify possible courses of action, evaluate the risk inherent in each course of action, and make the appropriate decision. *Instructor intervention is not required for the safe completion of the flight.*

**Not Observed** – Used if an event is not accomplished or required in the scenario.

---

**EVERYDAY USE OF FITS CONCEPTS**

**The PAVE Checklist**
Use the PAVE Checklist as an easy way to implement the FITS concepts. The PAVE checklist is
- A simple way to remember and examine the risk factors before you fly, and
- Can also help you manage the specific risks associated with taking off and landing

The PAVE checklist puts risk factors into four categories:
- **Pilot**
- **Aircraft**
- **Environment**
- **External pressures**

**The pilot.** Are you fatigued? When was the last time you were flying in the weather conditions that you will encounter? What are your personal minimums?

**The aircraft.** Are you familiar with the aircraft? Its avionics? Is it airworthy? What is the density altitude? How does that affect your climb rate? What is your maximum crosswind component?

**The environment.** Are the temperature and dew point close? Are you familiar with the area and its topography? Are there any NOTAMs?

**External pressures.** Are others influencing the flight? Do you have people waiting for you at the airport?

---

**KNOWLEDGE CONTENT**

**WEB-BASED KNOWLEDGE INSTRUCTION**
The web-based knowledge instruction should be completed before beginning the flight scenarios in each corresponding phase; you can work ahead as far in the course as you like at your discretion.
- However, the course is designed so that the web-based knowledge instruction corresponds to the flight scenarios within a phase
- If the phase web-based knowledge instruction is incomplete, your instructor can evaluate whether you are prepared to benefit from flying a particular scenario by checking your Phase Progress Report and one-on-one discussion and questions using the Ground Training Checklist

If you have an extended time lapse between studying the web-based knowledge instruction and flying the companion scenario, you will find it very helpful to take some time to review your last knowledge sessions just before you fly the associated scenario.

You complete the web-based knowledge instruction satisfactorily by answering all the questions correctly. Your instructor will
- Review your results before you fly
- Answer any questions you may have
REQUIRED AERONAUTICAL KNOWLEDGE AREAS
The Federal Aviation Regulations, 14 CFR Parts 61 and 141, list aeronautical knowledge areas that must be included in the ground training for an Instrument Rating Course. All required areas are covered in this course, but they are distributed throughout the curriculum for subject continuity and logical development. You will find these required topics included in lessons listed as follows:

(1) Applicable Federal Aviation Regulations for IFR flight operations
PHASE 3; 3.4.2 Airspace
    The Airspace System
    Glass G Airspace
    Class E Airspace
    Class D Airspace
    Class C Airspace
    Class B Airspace
    Class A Airspace
PHASE 3; 3.4.3 Weather Minimums
    VFR Weather Minimums
    Special VFR
PHASE 5; 5.1.1 Instrument Flight Rules
    Pilot and Airplane IFR Requirements
    Maintaining Your IFR Skills
    Continuing Beyond the Missed Approach Point
PHASE 7; 7.1.1 Cross-Country IFR
    IFR Procedures and Reports
PHASE 7; 7.2.1 IFR Cross-Country Planning
    IFR Flight Planning (Alternate rules)

(2) Appropriate information in the "Aeronautical Information Manual"
PHASE 6; 6.3.1 Clearances, Procedures, and Responsibilities
    Aeronautical Information Manual (AIM)

(3) Air traffic control system and procedures for instrument flight operations
PHASE 3; 3.4.1 IFR Departures
    Departing Airports With Control Towers
    Departing Airports Without Control Towers
PHASE 3; 3.4.2 Airspace
    The Airspace System
PHASE 4; 4.1.1 Holding Patterns
    The Holding Pattern
    How to Fly a Holding Pattern
    Holding Pattern Entries
    Holding at Intersections and Wayponts
    Flying Holding Patterns with the G1000
PHASE 4; 4.1.2 Arrivals
    Format and Symbols on STAR Charts
    Loading and Flying Arrival Procedures
PHASE 4; 4.2.1 Flying DME Arcs
    DME Arcs Using VOR and DME
    DME Arcs Using the G1000
PHASE 6; 6.3.1 Clearances, Procedures, and Responsibilities
    Clearances
    IFR Clearances That Include VFR Conditions
    Radar Services in the Terminal Area
PHASE 6; 6.4.1 ATC Procedures
   Increasing Traffic Flow
   Communications Failure
   Complete Radio Failure

(4) IFR navigation and approaches by use of navigation systems

PHASE 3; 3.1.1 RNAV and GPS Navigation
   GPS Requirements and Using GPS for IFR
PHASE 3; 3.1.2 Required Navigation Performance (RNP)
   Understanding RNP
   What WAAS Does for You
PHASE 3; 3.1.3 Using GPS for Navigation
   Creating and Modifying a GPS Flight Plan
   Enroute GPS
   Loading Instrument Procedures
PHASE 3; 3.2.1 NDB Navigation
   Understanding the ADF
   Homing and Bearings to the Station
   The Movable Card Indicator ADF
   Intercepting and Tracking NDB Bearings
   RMI Orientation and Navigation
PHASE 3; 3.3.1 VOR Navigation
   VOR Checks
   VOR Navigation
   Receiving Localizers on VOR Radios
   Intercepting and Tracking VOR Radials
   Using an HSI for VOR Navigation
PHASE 5; 5.2.1 Instrument Landing System (ILS) Components
   Guidance
   Range
   Visual Components
   Runway Visual Range (RVR)
   Inoperative ILS Components
PHASE 5; 5.2.2 How to Fly an ILS
   Choosing Which Approach to Fly
   Self-Briefing the Approach
   Setting Up for the Approach
   Flying the ILS
   Flying the Missed Approach
PHASE 5; 5.3.1 Localizer Approaches
   Flying a Localizer Front Course
   Flying a Localizer Back Course
   Flying SDF and LDA Approaches
   Flying DME Arcs to a Localizer
PHASE 5; 5.4.1 RNAV Approaches
   RNAV Approaches
PHASE 5; 5.4.2 RNAV (GPS) Approach Types
   LPV and LP Approaches
   LNAV/VNAV Approach
   LNAV Approach
   GPS Missed Approach
PHASE 6; 6.2.1 VOR Approaches
VOR Approach
PHASE 6; 6.2.2 Flying the NDB Approach
NDB Approach
PHASE 6; 6.3.2 Circling, Contact, and Visual Approaches
Circling Approaches
Contact and Visual Approaches

(5) Use of IFR en route and instrument approach procedure charts

PHASE 2; 2.1.1 Low Altitude Enroute Charts
Airspace
Airports and Navaids
Airways
Intersections and Reporting PO ints
Altitudes
More Altitudes
PHASE 3; 3.4.1 IFR Departures
Departure Procedure Charts (ODPs and SIDs)

PHASE 4; 4.3.1 Approach Charts and Approach Chart Segments
Approach Segments
Overview of Approach Charts
Approach Chart Design

PHASE 4; 4.3.2 Sections of the Approach Chart
Margin Identification
Pilot Briefing
Plan View
Profile View
Minimums Section
Airport Sketch

(6) Procurement and use of aviation weather reports and forecasts, and the elements of forecasting weather trends on the basis of that information and personal observation of weather conditions

PHASE 2; 2.4.1 Current Weather Reports
Aviation Routine Weather Report (METAR)
Automated Weather Observations (ASOS/AWOS)
PHASE 2; 2.4.2 Weather Forecasts
Terminal Aerodrome Forecast (TAF)
Area Forecast (FA)
Winds and Temperature Aloft Forecast (FD)
PHASE 2; 2.4.3 In-Flight Weather Advisories and Services
In-Flight Weather Advisories
Supplemental and In-Flight Weather Services
PHASE 2; 2.4.4 Current Weather Charts
Surface Analysis Chart
Weather Depiction Chart
Radar Summary Chart
PHASE 2; 2.4.5 Forecast Weather and Upper Air Charts
Low Level Significant Weather Prognostic Charts
High Level Significant Weather Prognostic Charts
Severe Weather Forecasts
More Upper Air Charts
(7) Safe and efficient operation of aircraft under instrument flight rules and conditions
   PHASE 1; 1.2.2 Putting IFR Skills Together
      Good Habits for IFR Flying
   PHASE 2; 2.1.2 Copying an IFR Clearance and Staying Organized
      How to Copy a Clearance
      Cockpit Organization
   PHASE 3; 3.4.1 IFR Departures
      Safe IFR Departures
   PHASE 8; 8.1.1 Instrument Rating Practical Test
      Your New Rating

(8) Recognition of critical weather situations and wind shear avoidance
   PHASE 1; 1.4.1 IFR Risks and Hazards
      General Aviation Instrument Flying
      Risk Awareness and Recognizing Hazards
   PHASE 2; 2.2.3 Moisture in the Air
      Fog
      Ice
   PHASE 2; 2.2.4 Weather Hazards
      Thunderstorms
      Wind Shear
      Microbursts
      Practical Tips for Flying in Rough Weather
   PHASE 7; 7.3.1 Tips and Tools
      Avoiding Special Hazards at Airports (Wake Turbulence)
      Flying in Icing Conditions

(9) Aeronautical decision making and judgment
   PHASE 1; 1.4.2 Single-Pilot Resource Management (SRM)
      Aeronautical Decision Making (ADM)
   PHASE 7; 7.3.1 Risk Management
      Personal Minimums
      PAVE Checklist
      CARE Checklist
      Two Rules for Safe IFR Flying

(10) Crew resource management, to include crew communication and coordination
   PHASE 1; 1.4.2 Single-Pilot Resource Management (SRM)
      Single-Pilot Resource Management (SRM)
CESSNA PILOT CENTER (CPC) KNOWLEDGE TEST
Cessna’s online pilot training includes a separate FAA question review that
• Contains examples of FAA knowledge test questions
• Provides the answers and explanations of the correct and incorrect answer choices
• Prepares you to take the CPC and the FAA knowledge test

Before graduating from the course, you will take your Cessna Pilot Center (CPC) knowledge test. This test
• Has questions covering the required FAA knowledge areas
• Counts as your CPC final knowledge exam for the course
• Is taken and proctored at your Cessna Pilot Center using the Randomly Generated Exam feature section of your course selecting
  o Practice Exams
  o Randomly Generated Exam
  o Start New, and
  o If random exams have been taken previously, select OK to overwrite previous results

When you have completed all the questions in your Cessna Pilot Center knowledge test
• Select “Finish / Suspend”
• Select “Finish”, and then
• Your proctor will
  o Select View Exam Results
  o Print the Exam Results Summary, and
  o Select View Exam Detail and note any question not answered correctly

When you have finished the test, your instructor will
• Review the results with you
• Assign appropriate areas for review if necessary

After taking the CPC knowledge test you should then take the FAA knowledge test as soon as possible, as the information will be fresh in your memory.

CREDIT FOR PREVIOUS TRAINING (WHEN ENROLLING INTO PART 141 CURRICULUM)
According to FAR 141.77(c), when you transfer from one FAA-approved school to another approved school, course credits you earned in your previous course of training may be credited for part of your training by your new school.
• Your new school may determine the amount of credit you are allowed by a knowledge test and a flight proficiency test
• Credit for aeronautical knowledge instruction may be determined by a knowledge test alone
• Maximum credit allowed is 50% of the curriculum requirements of your new school

If you transfer from other than an FAA-approved school, you may receive credit for the knowledge and flight experience. Up to a maximum of 25% of the curriculum requirements of the course to which you are transferring to may be credited.

CREDIT FOR PREVIOUS TRAINING (WHEN ENROLLING INTO PART 61 CURRICULUM)
If you are enrolling into a Part 61 course, all flight training logged, from an authorized instructor, applies to the minimum required flight time under Part 61. Your new flight school
• Will evaluate your flight proficiency and knowledge in all required areas of operation and aeronautical knowledge
• Determine the appropriate starting point in the syllabus to continue your training

GUARANTEE OF QUALITY
This multimedia online pilot training system is available exclusively through Cessna Pilot Centers. It is structured so that you receive the highest quality pilot training at any Cessna Pilot Center located around the world.
Stage 1 consists of two Phases
- Developing Instrument Skills
- Polishing Instrument Skills

Stage Objective: During this stage you will
- Become familiar with the training airplane
- Review safe practices and checklist usage
- Review runway incursion avoidance procedures
- Safely control the airplane using proper instrument cross-check and interpretation
- Fly in simulated or actual instrument conditions using basic instrument flight maneuvers
- Learn how to file an IFR flight plan and receive an IFR clearance
- Practice flying by reference to instruments without the use of a heading indicator
- Become familiar with controlling the airplane without reference to the primary flight instruments
- Be able to recover from unusual flight attitudes with reference to instruments only
- Fly with a check instructor to evaluate your progress and instructor pairing

Each phase contains Web-based Knowledge Instruction
- The web-based knowledge instruction for the phase should be completed prior to starting the flight scenarios to ensure fundamental knowledge before the flight.

Each phase contains multiple Flight Scenarios that can be
- Customized for your local training environment
- Repeated, or
- Omitted if all items in the Phase Proficiency Checklist are completed to standard.

At the end of each Phase are the Ground Training Checklist and Phase Proficiency Checklist
- All items in the checklist must be completed to the appropriate standard listed before the Phase is considered complete.
PHASE 1: Developing Instrument Skills

Phase Objective: During this phase you will learn

- Preflight preparation for IFR flight
- Instrument scan techniques
- Basic instrument flight maneuvers
- Use of the magnetic compass and timed turns in the case of a heading indicator failure
- Postflight procedures for IFR flight

Web-based KNOWLEDGE

EXPLORING INSTRUMENT FLYING
FLIGHT INSTRUMENTS
RADIO NAVIGATION AIDS AND THE MAGNETIC COMPASS
SINGLE-PILOT RESOURCE MANAGEMENT

1.1 EXPLORING INSTRUMENT FLYING

Objectives: You will learn about human sensory systems, how to control the airplane by reference to instruments only, and the importance of checking your instruments before flight.

1.1.1 Becoming an Instrument-Rated Pilot
How You’ll Become Instrument-Rated

1.1.2 Physiology
Sensory Systems
Spatial Disorientation

1.1.3 Instrument Flying Technique
Heading and Altitude
Leaving Straight-and-Level
Primary Instruments
Supporting Instruments

1.1.4 Getting Ready for Flight
Before You Get Into the Airplane
IFR Preflight
Checking the Instruments

1.2 FLIGHT INSTRUMENTS

Objective: You will understand how electronic and standby flight instruments work along with their associated systems.

1.2.1 Flight Instruments
Gyrosopic Principles and Attitude Heading Reference Systems (AHRS)
How Your Attitude and Heading Gyros Work
How Your Electric Turn Coordinator Gyro Works
Pressure Sensing Flight Instruments and Air Data Computers (ADC)
Pitot or Static System Blockage
Altitude Types and How to Read the Altimeter
Using the G1000 PFD
Using the G1000 MFD

1.2.2 Putting IFR Skills Together
Good Habits for IFR Flying
Turning Climbs and Descents
1.3 RADIO NAVIGATION AIDS AND THE MAGNETIC COMPASS

**Objective:** You will gain understanding of VORs, how speed affects turn radius, and how to use a magnetic compass and clock when the heading indicator has failed.

- **Electronic Navigation Aids**
  - VHF Omni-directional Range (VOR)
  - The VOR Indicator and How to Use It
  - Horizontal Situation Indicator (HSI)
  - Distance Measuring Equipment (DME)
  - Understanding RNAV and GPS

- **Turns**
  - Understanding Forces in a Turn and Controlling Load Factor
  - Limiting Load Factor in Turbulence
  - Controlling Your Rate and Radius of Turn

- **Flying Without a Heading Indicator**
  - Magnetic Compass Errors
  - Timed Turns

1.4 SINGLE-PILOT RESOURCE MANAGEMENT

**Objective:** You will discover the art and science of managing all resources available to a pilot to ensure the successful outcome of a flight.

- **IFR Risks and Hazards**
  - General Aviation Instrument Flying
  - Risk Awareness and Recognizing Hazards

- **Single-Pilot Resource Management (SRM)**
  - Single-Pilot Resource Management (SRM)
  - Risk Management (RM)
  - Task Management (TM)
  - Situational Awareness (SA)
  - Controlled Flight Into Terrain (CFIT) Awareness
  - Automation Management (AM)
  - Aeronautical Decision Making (ADM)

**FLIGHT SCENARIOS**

DEVELOPING YOUR INSTRUMENT SCAN
IMPROVING YOUR INSTRUMENT SKILLS
LOSS OF HEADING INDICATOR (G1000)
LOSS OF HEADING INDICATOR (ANALOG)

*Flight scenarios will be repeated as necessary to reach the desired proficiency*
SCENARIO 1: Developing Your Instrument Scan

Objective:
Understand instrument preflight procedures and the preparation necessary for an IFR flight. Experience flying by reference to instruments only while developing proper instrument cross-check and interpretation skills, and aircraft control skills.

Purpose/pressures (real or simulated):
You have just purchased a new airplane and have arranged to fly it home from the manufacturer with an experienced, but non-instrument rated, pilot friend. You have a narrow window following your factory training to pick up the plane, or you will have to wait a month. You have to be in your office the next day.

Where to go:
A point within 30 minutes flight time that is in suitable airspace free from obstructions and dense traffic

How to get there:
Vectors

Planned deviations:
As necessary to react to inadvertent IMC

Planned malfunctions:
None

Risks (real or simulated):
Marginal VFR at departure, expected to be clear at your home field (VFR pilot possibly flying into IMC / spatial disorientation)
Unfamiliarity with new airplane and new avionics
Overconfidence because of the second pilot

New this scenario:
Evaluating weather information
Preflight inspection
Checklist usage
Instrument cockpit check
Cockpit management
Positive exchange of flight controls
Collision avoidance (visually and in response to ATC traffic calls)
Correlating airport diagrams with taxiway and runway signs and markings
Pitch and power settings required for basic instrument maneuvers
Basic instrument flight maneuvers
  Straight-and-level flight
  Standard rate level turns
  Constant airspeed climbs and descents
  Level-offs

Postflight procedures
SCENARIO 2: Improving Your Instrument Skills
*ATD MAY BE USED*

Note: Although an ATD may be used for this scenario, the maximum time that may be credited is 10 hours (BATD) or 20 hours (AATD) instrument time for a Part 61 course [61.65(i)] or 25% (BATD) or 40% (AATD) of the total instrument training requirement (35 hours) for a Part 141 course [141 Appendix C, 4.(b)(3)].

Objective:
Continue learning the preparation necessary for an IFR flight and improve your instrument flying skills including instrument cross-check and interpretation, and aircraft control.

Purpose/pressures (real or simulated):
You have planned to fly to a nearby airport for an air show. You will be running a booth there for your business.

Where to go:
A point within 30 minutes flight time that is in suitable airspace free from obstructions and dense traffic

How to get there:
Vectors

Planned deviations:
As necessary to react to inadvertent IMC

Planned malfunctions:
None

Risks (real or simulated):
Unreported low ceilings and visibilities en route (VFR pilot possibly flying into IMC / spatial disorientation)

New this scenario:
Preflight preparation
Weather briefing and/or acceptable weather sources
Takeoff and landing data
Weight and balance
Charts
Risk management

Basic instrument flight maneuvers
Airspeed changes in level flight
180-degree standard rate turns
Constant rate climbs and descents
Constant rate climbs and descents with constant airspeed
Turning climbs and descents

Improving your skills:
Evaluating weather information
Preflight inspection
Checklist usage
Instrument cockpit check
Cockpit management
Positive exchange of flight controls
Collision avoidance (visually and in response to ATC traffic calls)
Correlating airport diagrams with taxiway and runway signs and markings
Pitch and power setting required for basic instrument maneuvers

Basic instrument flight maneuvers
Straight-and-level flight
Standard rate level turns
Constant airspeed climbs and descents
Turning climbs and descents
Level-offs

Postflight procedures
Stage 1, Phase 1: Developing Instrument Skills

SCENARIO 3: Loss of Heading Indicator (G1000)
SCENARIOS 3 AND 4 ARE EQUIVALENT. IF YOU CHOOSE TO FLY SCENARIO 3, IT MUST BE FLOWN IN A G1000-EQUIPPED AIRPLANE.

Objective:
Improve basic control while flying by reference to instruments only, and learn how to use the compass in the event of an unreliable heading indicator.

Purpose/pressures (real or simulated):
You are an aerial photographer that has been contracted by a local land development company to take pictures of a proposed building site. The company needs the pictures by 8 am tomorrow.

Where to go:
A point within 30 minutes flight time in suitable airspace free from obstructions and dense traffic

How to get there:
Vectors

Planned deviations:
None

Planned malfunctions:
Red X on HSI (simulated with PFD mask; reversionary mode not available)

Risks (real or simulated):
Ceiling drops as you approach the site (inadvertent IMC and possible loss of control)
Loss of HSI (subsequently difficulty in following ATC instructions)
Revised primary instrument scan (possible loss of control)

New this scenario:
Loss of primary flight instrument- heading indicator
Compass turns to magnetic headings
Timed turns to magnetic headings

Improving your skills:
Preflight preparation
  Weather briefing and/or acceptable weather resources
  Takeoff and landing data
  Weight and balance
  Charts
  Risk management
Preflight inspection
Checklist usage
Instrument cockpit check
Cockpit management
Correlating airport diagrams with taxiway and runway signs and markings
Basic instrument flight maneuvers
  Straight-and-level flight
  Standard rate level turns
  180-degree standard rate turns
  Airspeed changes in level flight
  Constant airspeed climbs and descents
  Constant rate climbs and descents with constant airspeed
  Turning climbs and descents
  Level-offs
Postflight procedures
SCENARIO 4: Loss of Heading Indicator (ANALOG)

SCENARIONS 3 AND 4 ARE EQUIVALENT. IF YOU CHOOSE TO FLY SCENARIO 4, IT MUST BE FLOWN IN AN AIRPLANE WITH ANALOG FLIGHT INSTRUMENTS.

Objective:
Improve basic control while flying by reference to instruments only, and learn how to use the compass in the event of an unreliable heading indicator.

Purpose/pressures (real or simulated):
You are an aerial photographer who has been contracted by a local land development company to take pictures of a proposed building site. The company needs the pictures by 8 am tomorrow.

Where to go:
A point within 30 minutes flight time in suitable airspace free from obstructions and dense traffic

How to get there:
Vectors

Planned deviations:
None

Planned malfunctions:
Heading indicator becomes unreliable (simulated with cover over heading indicator)

Risks (real or simulated):
Ceiling drops as you are approaching the area of the development site (inadvertent IMC)
Unreliable heading indicator (subsequent difficulty in following ATC instructions)

New this scenario:
Loss of primary flight instrument / heading indicator
Compass turns to magnetic headings
Timed turns to magnetic headings

Improving your skills:
Preflight preparation
   Weather briefing and/or acceptable weather resources
   Takeoff and landing data
   Weight and balance
   Charts
   Risk management

Preflight inspection

Checklist usage

Instrument cockpit check

Cockpit management

Correlating airport diagrams with taxiway and runway signs and markings

Basic instrument flight maneuvers
   Straight-and-level flight
   Standard rate level turns
   180-degree standard rate turns
   Airspeed changes in level flight
   Constant airspeed climbs and descents
   Constant rate climbs and descents with constant airspeed
   Turning climbs and descents
   Level-offs

Postflight procedures
# Stage 1, Phase 1: Developing Instrument Skills

## Phase 1 Ground Training Checklist

*All items to be graded independently by the instructor and customer, then discussed and a final grade assessed.*

*Desired outcome for all tasks by the end of the phase is “Explain”*

### Preflight procedures

| Evaluating weather information |          |         |                 |
| *Can accurately evaluate weather data from an FAA-approved source* | |         |                 |
| Weather briefing and/or acceptable weather sources |          |         |                 |
| *Knows FAA-approved weather resources and proper format to request an IFR weather briefing* | |         |                 |

| Takeoff and landing data |          |         |                 |
| *Accurately calculates the required takeoff and landing distances* | |         |                 |

| Weight and balance |          |         |                 |
| *Determines that the flight will be conducted within weight and balance limitations* | |         |                 |

| Charts |          |         |                 |
| *Has current aeronautical charts and publications* | |         |                 |

| Preflight inspection |          |         |                 |
| *Can perform a safe preflight inspection without instructor assistance* | |         |                 |

| Cockpit management |          |         |                 |
| *Organizes the cockpit, has easy access to the checklist and utilizes items such as a kneeboard, paper and pen/pencil to record information* | |         |                 |

| Checklist usage |          |         |                 |
| *Uses checklist for preflight and all phases of flight* | |         |                 |

| Positive exchange of flight controls |          |         |                 |
| *Uses the 3-part verification system to confirm who has control of the airplane* | |         |                 |

| Correlating airport diagrams with taxiway and runway signs and markings |          |         |                 |
| *Uses the airport diagram, if available, for situational awareness* | |         |                 |

| Instrument cockpit check |          |         |                 |
| *Performs an instrument cockpit check to ensure all required items are in working order prior to flight* | |         |                 |

### Phase 1 completion standards:
You have completed Phase 1 when you
- Know and can complete all preflight preparation required for an instrument flight
- Can determine the airplane is safe for IFR flight
- Can safely control the airplane by reference to instruments only
- Can perform basic instrument flight maneuvers
- Have reviewed the Phase Progress Report with your instructor
Stage 1, Phase 1: Developing Instrument Skills

INSTRUCTOR NOTES:
PHASE 2: Polishing Instrument Skills

Phase Objective: During this phase you will develop the skills necessary to
- File an IFR flight plan
- Receive, copy and fly an IFR clearance
- More precisely control the airplane by reference to instruments only
- Control the airplane with failure of primary flight instruments
- Recover from an unusual flight attitude

Web-based KNOWLEDGE

IFR ENROUTE CHARTS, CLEARANCES, AND STAYING ORGANIZED
UNDERSTANDING THE WEATHER
INSTRUMENT FAILURES AND UNUSUAL ATTITUDES
READING THE WEATHER

2.1 IFR ENROUTE CHARTS, CLEARANCES, AND STAYING ORGANIZED

Objective: You will explore IFR low altitude enroute charts, techniques for writing down an ATC clearance, and how to stay organized.

2.1.1 Low Altitude Enroute Charts
- Airspace
- Airports and Navaids
- Airways
- Intersections and Reporting Points
- Altitudes
  - More Altitudes

2.1.2 Copying an IFR Clearance and Staying Organized
- How to Copy a Clearance
- Cockpit Organization

2.2 UNDERSTANDING THE WEATHER

Objective: You will know the causes of various weather conditions, frontal systems, and hazardous weather phenomena.

2.2.1 Weather Theory
- What Makes Weather
- The Atmosphere
- Wind Circulation
- Water Vapor and Cloud Types

2.2.2 Weather Patterns
- Stable and Unstable Air
- Air Masses and Fronts

2.2.3 Moisture in the Air
- Fog
- Ice

2.2.4 Weather Hazards
- Thunderstorms
- Wind Shear
- Microbursts

Practical Tips for Flying in Rough Weather
2.3 INSTRUMENT FAILURES AND UNUSUAL ATTITUDES

Objective: You will identify when an instrument or system has failed and be able to recognize and recover from an unusual attitude.

2.3.1 Instrument Failure
- G1000 Failures Including AHRS and ADC
- Figuring Out Which Instruments Have Failed
- Partial Panel
- Recovering From Unusual Attitudes

2.4 READING THE WEATHER

Objective: You will gain skill in reading weather reports, forecasts, and interpreting weather charts.

2.4.1 Current Weather Reports
- Aviation Routine Weather Report (METAR)
- Automated Weather Observations (ASOS/AWOS)

2.4.2 Weather Forecasts
- Terminal Aerodrome Forecast (TAF)
- Area Forecast (FA)
- Winds and Temperatures Aloft Forecast (FD)

2.4.3 In-Flight Weather Advisories and Services
- In-Flight Weather Advisories
- Supplemental and In-Flight Weather Services

2.4.4 Current Weather Charts
- Surface Analysis Chart
- Weather Depiction Chart
- Weather Radar Information

2.4.5 Forecast Weather and Upper Air Charts
- Low Level Significant Weather Prognostic Charts
- High Level Significant Weather Prognostic Charts
- Severe Weather Forecasts
- More Upper Air Charts

FLIGHT SCENARIOS

IFR FLIGHT PREPARATION AND CLEARANCE
UNUSUAL ATTITUDES AND FAILED INSTRUMENTS (G1000)
UNUSUAL ATTITUDES AND FAILED INSTRUMENTS (ANALOG)
UNUSUAL ATTITUDES AND FAILED INSTRUMENTS (G1000 ATD)
INCREASING PROFICIENCY (G1000)
INCREASING PROFICIENCY (ANALOG)
*PROGRESS CHECK* (G1000)
*PROGRESS CHECK* (ANALOG)

*Flight scenarios will be repeated as necessary to reach the desired proficiency*

**Please note that “Postflight procedures”, such as “After landing, parking and securing”, will be omitted from each Phase Proficiency Checklist hereon and are expected to be performed as a part of normal flight procedures**
SCENARIO 1: IFR Flight Preparation and Clearance

*ATD MAY BE USED*

Note: Although an ATD may be used for this scenario, the maximum time that may be credited is 10 hours (BATD) or 20 hours (AATD) instrument time for a Part 61 course [61.65(j)] or 25% (BATD) or 40% (AATD) of the total instrument training requirement (35 hours) for a Part 141 course [141 Appendix C, 4.(b)(3)].

Objective:
Develop skills in preparing for an IFR flight including: weather briefings, filing the flight plan, and copying, understanding, and flying an IFR clearance.

Purpose/pressures (real or simulated):
You are on a scheduled out and return training flight to an airport less than 50 nautical miles away and will drop off an airplane part for a stranded pilot. You need to hurry to get the part there before the mechanic goes home.

Where to go:
A nearby airport with an instrument approach

How to get there:
Follow your instrument clearance, vectors

Planned deviations:
None

Planned malfunctions:
None

Risks (real or simulated):
Lack of familiarity with copying clearances (likelihood of misunderstanding clearance)

New this scenario:
Filing an IFR flight plan
Alternate planning
How to receive your clearance
Copying your clearance
Compliance with ATC clearance(s)

Improving your skills:
Preadaptation preparation
Preadaptation inspection
Checklist usage
Cockpit management
Collision avoidance
Basic instrument flight maneuvers
Timed turns to magnetic headings
Compass turns to magnetic headings
Stage 1, Phase 2: Polishing Instrument Skills

SCENARIO 2: Unusual Attitudes and Failed Instruments (G1000)

*G1000 ATD MAY BE USED*

SCENARIOS 2, 3 AND 4 ARE EQUIVALENT. IF YOU CHOOSE TO FLY SCENARIO 2, IT MUST BE FLOWN IN A G1000-EQUIPPED AIRPLANE OR ATD.

Note: Although an ATD may be used for this scenario, the maximum time that may be credited is 10 hours (BATD) or 20 hours (AATD) instrument time for a Part 61 course [61.65(i)] or 25% (BATD) or 40% (AATD) of the total instrument training requirement (35 hours) for a Part 141 course [141 Appendix C, 4.(b)(3)].

Objective:
Recover the airplane from unusual flight attitudes, recognize primary flight instrument failures and control the aircraft using standby instruments.

Purpose/pressures (real or simulated):
You and a friend are flying to an airport 80 miles away for an aerobatic competition he has entered. To participate, your friend must attend the mandatory 7 am pilot briefing.

Where to go:
A point within 20 minutes flight time that is in suitable airspace free from obstructions and dense traffic

How to get there:
Vectors and/or simulated clearance

Planned deviations:
To a suitable airport to deal with failures

Planned malfunctions:
PFD failure (simulated by dimming the PFD) (not simultaneously with next malfunction)
AHRS and ADC failure (simulated with PFD mask; reversionary mode not available)

Risks (real or simulated):
Departure airport weather is broken at 2,200 feet and tops are unknown as there are no PIREPS
Mountain ridge between your departure and destination airports, with strong winds aloft (turbulence and possible loss of control)
Loss of primary flight display (PFD) (possible loss of control)
Loss of all primary flight instruments (possible loss of control)

New this scenario:
Loss of primary flight instruments
Recovery from unusual flight attitudes

Improving your skills:
Preflight preparation
Preflight inspection
Compliance with ATC clearance(s)
Runway incursion avoidance procedures
Collision avoidance
Basic instrument flight maneuvers
SCENARIO 3: Unusual Attitudes and Failed Instruments (ANALOG)

*ANALOG ATD MAY BE USED*

SCENARIOS 2, 3, AND 4 ARE EQUIVALENT. IF YOU CHOOSE TO FLY SCENARIO 3, IT MUST BE FLown in an AIRPLANE OR ATD WITH ANALOG FLIGHT INSTRUMENTS.

Note: Although an ATD may be used for this scenario, the maximum time that may be credited is 10 hours (BATD) or 20 hours (AATD) instrument time for a Part 61 course [61.65(i)] or 25% (BATD) or 40% (AATD) of the total instrument training requirement (35 hours) for a Part 141 course [141 Appendix C, 4.(b)(3)].

Objective:
Recover the airplane from unusual flight attitudes, recognize primary flight instrument failures and control the aircraft using the remaining instruments.

Purpose/pressures (real or simulated):
You and a friend are flying to an airport 80 miles away for an aerobatic competition he has entered. To participate, your friend must attend the mandatory 7:00 am pilot briefing.

Where to go:
A point within 20 minutes flight time that is in suitable airspace free from obstructions and dense traffic

How to get there:
Vectors and/or simulated clearance

Planned deviations:
To a suitable airport to deal with failures

Planned malfunctions:
Vacuum system failure (simulated with covers over attitude indicator and heading indicator) (not simultaneously with next malfunction)
Clogged pitot tube (simulated with cover over airspeed indicator) (not simultaneously with previous malfunction)

Risks (real or simulated):
Departure airport weather is broken at 2,200 feet and tops are unknown as there are no PIREPS
Mountain ridge between your departure and destination airports, with strong winds aloft (turbulence and possible loss of control)
Loss of attitude indicator and heading indicator (possible loss of control)
Loss of airspeed indicator (possible loss of control)

New this scenario:
Loss of primary flight instruments
Recovery from unusual flight attitudes

Improving your skills:
Preflight preparation
Preflight inspection
Compliance with ATC clearance(s)
Runway incursion avoidance procedures
Collision avoidance
Basic instrument flight maneuvers
SCENARIO 4: Unusual Attitudes and Failed Instruments (G1000 ATD)
*G1000 ATD ONLY*
SCENARIOS 2, 3, AND 4 ARE EQUIVALENT. IF YOU CHOOSE TO FLY SCENARIO 4, IT MUST BE FLOWN IN A SUITABLE G1000 ATD.

Note: Although an ATD may be used for this scenario, the maximum time that may be credited is 10 hours (BATD) or 20 hours (AATD) instrument time for a Part 61 course [61.65(i)] or 25% (BATD) or 40% (AATD) of the total instrument training requirement (35 hours) for a Part 141 course [141 Appendix C, 4.(b)(3)].

Objective:
Recover from unusual flight attitudes, recognize primary flight instrument failures and control the aircraft using standby instruments.

Purpose/pressures (real or simulated):
You and a friend are flying to an airport 80 miles away for an aerobatic competition he has entered. To participate, your friend must attend the mandatory 7:00 am pilot briefing.

Where to go:
A point within 20 minutes flight time that is in suitable airspace free from obstructions and dense traffic

How to get there:
Vectors and/or simulated clearance

Planned deviations:
To a suitable airport to deal with failures

Planned malfunctions:
PFD failure (simulated by dimming the PFD) (not simultaneously with next malfunction)
AHRS failure (ATD simulation—reversionary mode does not fix) (not simultaneously with previous malfunction)
ADC failure (ATD simulation—reversionary mode does not fix) (not simultaneously with previous malfunctions)
AHRS and ADC failure (ATD simulation—reversionary mode does not fix)

Risks (real or simulated):
Departure airport weather is broken at 2,200 feet and tops are unknown as there are no PIREPS
Mountain ridge between your departure and destination airports, with strong winds aloft (turbulence and possible loss of control)
Loss of primary flight display (PFD) (possible loss of control)
Loss of primary attitude indicator (possible loss of control)
Loss of all primary flight instruments (possible loss of control)

New this scenario
Loss of primary flight instruments
Recovery from unusual flight attitudes

Improving your skills:
Preflight preparation
Preflight inspection
Compliance with ATC clearance(s)
Runway incursion avoidance procedures
Collision avoidance
Basic instrument flight maneuvers
SCENARIO 5: Increasing Proficiency (G1000)

*G1000 ATD MAY BE USED*

SCENARIOS 5 AND 6 ARE EQUIVALENT. IF YOU CHOOSE TO FLY SCENARIO 5, IT MUST BE FLOWN IN G1000-EQUIPPED AIRPLANE OR ATD.

Note: Although an ATD may be used for this scenario, the maximum time that may be credited is 10 hours (BATD) or 20 hours (AATD) instrument time for a Part 61 course [61.65(i)] or 25% (BATD) or 40% (AATD) of the total instrument training requirement (35 hours) for a Part 141 course [141 Appendix C, 4.(b)(3)].

Objective:
Increase your proficiency and accuracy with instrument cross-check and interpretation, and aircraft control.

Purpose/pressures (real or simulated):
You are taking a flight to accomplish important surveillance work. You are under contract to complete the survey within 24 hours.

Where to go:
A point within 20 minutes flight time that is in suitable airspace free from obstructions and dense traffic

How to get there:
Vectors and/or clearance

Planned deviations:
None

Planned malfunctions:
AHRS and ADC failure (simulated with PFD mask; reversionary mode not available)

Risks (real or simulated):
Area forecast calls for low ceilings and visibilities (inadvertent IMC)
Primary instrument failures (loss of control)

Improving your skills:
Preflight preparation
Compliance with ATC clearance(s)
Basic instrument flight maneuvers
Loss of primary flight instruments
Recovery from unusual flight attitudes
Timed turns to magnetic headings
Compass turns to magnetic headings
SCENARIO 6: Increasing Proficiency (ANALOG)
*ANALOG ATD MAY BE USED*
SCENARIOS 5 AND 6 ARE EQUIVALENT. IF YOU CHOOSE TO FLY SCENARIO 6, IT MUST BE FLOWN IN AN AIRPLANE OR ATD WITH ANALOG FLIGHT INSTRUMENTS.

Note: Although an ATD may be used for this scenario, the maximum time that may be credited is 10 hours (BATD) or 20 hours (AATD) instrument time for a Part 61 course [61.65(j)] or 25% (BATD) or 40% (AATD) of the total instrument training requirement (35 hours) for a Part 141 course [141 Appendix C, 4.(b)(3)].

Objective:
Increase your proficiency and accuracy with instrument cross-check and interpretation, and aircraft control.

Purpose/pressures (real or simulated):
You are taking a flight to accomplish important surveillance work. You are under contract to complete the survey within 24 hours.

Where to go:
A point within 20 minutes flight time that is in suitable airspace free from obstructions and dense traffic

How to get there:
Vectors and/or clearance

Planned deviations:
None

Planned malfunctions:
Vacuum system failure (simulated with covers over attitude indicator and heading indicator)

Risks (real or simulated):
Area forecast calls for low ceilings and visibilities (inadvertent IMC)
Primary instrument failures (loss of control)

Improving your skills:
Preflight preparation
Compliance with ATC clearance(s)
Basic instrument flight maneuvers
Loss of primary flight instrument indicators
Recovery from unusual flight attitudes
Timed turns to magnetic headings
Compass turns to magnetic headings
### Phase 2 Ground Training Checklist

*All items to be graded independently by the instructor and customer, then discussed and a final grade assessed.

**Desired outcome for all tasks by the end of the phase is “Explain”**

- Shorthand to write down the clearance
- System and instrument failures affecting IFR flights
- Recovery from unusual flight attitudes

<table>
<thead>
<tr>

</table>

#### Single-pilot resource management

- Risk management
  - Is able to identify any problem, analyze the information and make an informed decision with assistance

#### Preflight procedures

- Preflight preparation
  - Performs necessary items such as weather, takeoff and landing data, weight and balance, appropriate charts, and applies risk management in decision making

- Preflight inspection
  - Performs a preflight inspection finding the airplane airworthy for instrument flight

- Filing an IFR flight plan
  - Knows and uses the appropriate format to file an IFR flight plan

- Alternate planning
  - Recognizes when alternate planning is required or necessary

- How to receive your clearance
  - Knows how to contact ATC to receive an IFR clearance

- Copying your clearance
  - Uses shorthand to copy an IFR clearance

- Runway incursion avoidance procedures
  - Uses airport diagrams and writes down taxi clearances

- Checklist usage
  - Uses checklist for preflight and all phases of flight

- Cockpit management
  - Effectively maintains an organized cockpit environment and has necessary items within reach

#### In-flight

- Collision avoidance
  - Uses resources to ensure collision avoidance and responds to ATC traffic calls

- Basic instrument flight maneuvers
  - Maintains altitude ±150 feet, airspeed ±10 knots, heading ±15 degrees, bank ±5 degrees

- Timed turns to magnetic headings
  - Rolls out ±15 degrees of the desired heading and uses standard-rate turns

- Compass turns to magnetic headings
  - Knows the errors associated with the magnetic compass and can achieve desired headings

- Compliance with ATC clearances
  - Complies with clearances as necessary maintaining altitude ±150 feet and heading ±15 degrees

<p>| | | |</p>

Phase 2 Proficiency Checklist continued

Loss of primary flight instruments
  Recognizes the loss of a primary flight instrument indicator and safely controls the airplane without use of
  primary instruments, reports failure to ATC as necessary

Recovery from unusual flight attitudes
  Recovers using proper pitch, power, and bank inputs and restores positive aircraft control

Phase 2 completion standards:
You have completed Phase 2 when you
  ▪ Can accurately and safely prepare for an IFR flight
  ▪ Have improved your ability to more precisely fly basic instrument maneuvers
  ▪ Can use the magnetic compass and time to make turns to a desired heading
  ▪ Can copy, understand, and fly a clearance
  ▪ Have reviewed the Phase Progress Report with your instructor
  ▪ Pass the Progress Check

INSTRUCTOR NOTES:
SCENARIO 7: "Progress Check" (G1000)
The Progress Check is to be completed after completing the Phase 2 Proficiency Checklist. An appropriate instructor will check the progress of your learning and the effective pairing of you and your primary instructor.

SCENARIOS 7 AND 8 ARE EQUIVALENT. IF YOU CHOOSE TO FLY SCENARIO 7, IT MUST BE FLOWN IN A G1000-EQUIPPED AIRPLANE.

Objective:
To check that your progress in the course is sufficient to move to the next phase of training

Purpose/pressures (real or simulated):
You have an opportunity to do aerial survey work and you are being evaluated on your ability to use the instruments to precisely fly the airplane.

Where to go:
A point within 30 minutes that is suitable airspace free from obstructions and dense traffic

How to get there:
Vectors and/or clearance

Planned deviations:
None

Planned malfunctions:
AHRS and ADC failure (simulated with PFD mask; reversionary mode not available)

Risks (real or simulated):
Stress that arises with having your performance evaluated

Checking your knowledge and skills:
Preflight preparation
  Weather briefing and/or acceptable weather resources
  Takeoff and landing data
  Weight and balance
  Charts
  Risk management

Preflight inspection
Checklist usage
Instrument cockpit check
Cockpit management
Collision avoidance
Runway incursion avoidance
Basic instrument flight maneuvers
Loss of primary flight instruments
Timed turns to magnetic headings
Compass turns to magnetic headings
Recovery from unusual flight attitudes
Postflight procedures
SCENARIO 8: "Progress Check" (ANALOG)
The Progress Check is to be completed after completing the Phase 2 Proficiency Checklist. An appropriate instructor will check the progress of your learning and the effective pairing of you and your primary instructor.

SCENARIOS 7 AND 8 ARE EQUIVALENT. IF YOU CHOOSE TO FLY SCENARIO 8, IT MUST BE FLOWN IN AN AIRPLANE WITH ANALOG FLIGHT INSTRUMENTS.

Objective:
To check that your progress in the course is sufficient to move to the next phase of training

Purpose/pressures (real or simulated):
You have an opportunity to do aerial survey work and you are being evaluated on your ability to use the instruments to precisely fly the airplane.

Where to go:
A point within 30 minutes that is suitable airspace free from obstructions and dense traffic

How to get there:
Vectors and/or clearance

Planned deviations:
None

Planned malfunctions:
Vacuum system failure (simulated with covers over attitude indicator and heading indicator)

Risks (real or simulated):
Stress that arises with having your performance evaluated

Checking your knowledge and skills:
Preflight preparation
- Weather briefing and/or acceptable weather resources
- Takeoff and landing data
- Weight and balance
- Charts
- Risk management

Preflight inspection
Checklist usage
Instrument cockpit check
Cockpit management
Collision avoidance
Runway incursion avoidance
Basic instrument flight maneuvers
Loss of primary flight instruments
Timed turns to magnetic headings
Compass turns to magnetic headings
Recovery from unusual flight attitudes
Postflight procedures
## Phase 2 *Progress Check*

</tbody>
</table>

**Phase 2 *Progress Check* completion standards:**

You have completed the Phase 2 *Progress Check* when you
- Demonstrate knowledge of risk management
- Can perform the preparation necessary for an IFR flight
- Perform basic instrument flight maneuvers
Stage 1, Phase 2: Polishing Instrument Skills

INSTRUCTOR NOTES:
Stage 2 consists of two Phases
- GPS, NDB, and VOR, Navigation
- Holding Patterns and DME Arcs

Stage Objective: During this stage you will
- Become more familiar with VOR navigation and situational awareness
- Utilize GPS navigation and be familiar with its use for IFR
- Explore navigating with an NDB if your airplane has this equipment
- Safely control the airplane using proper instrument cross-check and interpretation
- Utilize published airways
- Discover instrument holding procedures including entry, reports, and patterns
- Be able to recover from unusual flight attitudes with reference to instruments only
- Discover DME arcs and their primary use
- Fly with a check instructor to check your course progress

Each phase contains Web-based Knowledge Instruction
- The web-based knowledge instruction for the phase should be completed prior to starting the flight scenarios to ensure fundamental knowledge before the flight.

Each phase contains multiple Flight Scenarios that can be
- Customized for your local training environment
- Repeated, or
- Omitted if all items in the Phase Proficiency Checklist are completed to standard.

At the end of each Phase are the Ground Training Checklist and Phase Proficiency Checklist
- All items in the checklist must be completed to the appropriate standard listed before the Phase is considered complete.
Phase Objective: During this phase you will develop the skills and confidence necessary to:

- Use RNAV and GPS for IFR navigation
- Use the NDB, if installed, for IFR navigation
- Use the VOR for IFR navigation
- Safely depart using published IFR procedures

Web-based KNOWLEDGE

UNDERSTANDING RNAV AND GPS NAVIGATION
UNDERSTANDING NDB NAVIGATION
UNDERSTANDING VOR NAVIGATION
IFR DEPARTURES AND THE AIRSPACE SYSTEM

3.1 UNDERSTANDING RNAV AND GPS NAVIGATION
Objective: You will gain insight on area navigation (RNAV) and using GPS as a navigation aid.

3.1.1 RNAV and GPS Navigation
- GPS Requirements and Using GPS for IFR

3.1.2 Required Navigation Performance (RNP)
- Understanding RNP
- What WAAS Does for You

3.1.3 Using GPS for Navigation
- Creating and Modifying a GPS Flight Plan
- Enroute GPS
- Loading Instrument Procedures

3.2 UNDERSTANDING NDB NAVIGATION
Objective: You will explore how to use an ADF and RMI for NDB navigation.

3.2.1 NDB Navigation
- Understanding the ADF
- Homing and Bearings to the Station
- The Moveable Card Indicator ADF
- Intercepting and Tracking NDB Bearings
- RMI Orientation and Navigation

3.3 UNDERSTANDING VOR NAVIGATION
Objective: You will gain knowledge about VOR checks, accuracy, orientation, how to intercept and track radials, and how to identify intersections.

3.3.1 VOR Navigation
- VOR Checks
- VOR Navigation
- Receiving Localizers on the VOR Radios
- Intercepting and Tracking VOR Radials
- Using an HSI for VOR Navigation

3.4 IFR DEPARTURES AND THE AIRSPACE SYSTEM
Objective: You will learn how to use published departure procedures, to depart under IFR at an airport with or without a control tower, and about the airspace system.

3.4.1 IFR Departures
- Safe IFR Departures
- Departure Procedure Charts (ODPs and SIDs)
- Loading and Flying Departure Procedures
- Departing Airports With Control Towers
- Departing Airports Without Control Towers
3.4.2 Airspace
   The Airspace System
   Class G Airspace
   Class E Airspace
   Class D Airspace
   Class C Airspace
   Class B Airspace
   Class A Airspace

3.4.3 Weather Minimums
   VFR Weather Minimums
   Special VFR

**FLIGHT SCENARIOS**

GPS FOR IFR USE AND ADF/NDB NAVIGATION (IF INSTALLED)
VOR NAVIGATION
FLYING PUBLISHED DEPARTURE PROCEDURES

*Flight scenarios will be repeated as necessary to reach the desired proficiency*
**SCENARIO 1: GPS for IFR Use and ADF/NDB Navigation (If Installed)**

*ATD MAY BE USED*

Note: Although an ATD may be used for this scenario, the maximum time that may be credited is 10 hours (BATD) or 20 hours (AATD) instrument time for a Part 61 course [61.65(i)] or 25% (BATD) or 40% (AATD) of the total instrument training requirement (35 hours) for a Part 141 course [141 Appendix C, 4.(b)(3)].

**Objective:**
Familiarize yourself with the GPS and its use for IFR navigation. If your airplane has a functioning ADF, you will navigate using a non-directional beacon (NDB).

**Purpose/pressures (real or simulated):**
You are flying with two friends to a ski destination and back.

**Where to go:**
A nearby airport

**How to get there:**
IFR flight plan using GPS waypoints, and NDB bearings if an ADF is installed and an NDB is available

**Planned deviations:**
To a suitable airport to deal with en route icing

**Planned malfunctions:**
RAIM unavailable
NDB loss of signal

**Risks (real or simulated):**
Navigation errors due to unreliable signals
Each of you is carrying ski boots and extra clothes
Runway has light snow on it
AIRMET Zulu and Sierra are valid for the route of flight (possibility of encountering structural icing and IMC or mountain obscurations)
Destination airport is 6,388 feet MSL

**New this scenario:**
Aeronautical decision making
Determining suitability of GPS for IFR flight
Familiarity with avionics
Navigation system orientation (GPS and/or NDB)
Navigation system course intercepting and tracking (GPS and/or NDB)
Navigating to a waypoint or an off-airway fix at a safe altitude

**Improving your skills:**
Risk management
Checklist usage
SCENARIO 2: VOR Navigation

*ATD MAY BE USED*

Note: Although an ATD may be used for this scenario, the maximum time that may be credited is 10 hours (BATD) or 20 hours (AATD) instrument time for a Part 61 course [61.65(i)] or 25% (BATD) or 40% (AATD) of the total instrument training requirement (35 hours) for a Part 141 course [141 Appendix C, 4.(b)(3)].

Objective:
Enhance your skill in using the VOR for situational awareness and intercepting and tracking radials

Purpose/pressures (real or simulated):
You are meeting business associates at a nearby airport to sign time-sensitive documents.

Where to go:
En route to a nearby single-runway (simulated if necessary) airport using victor airways, airspace that is free from obstructions and dense traffic to practice intercepting and tracking courses using VOR radials

How to get there:
VOR navigation, vectors

Planned deviations:
Route and destination changes for unforecast convective activity and airport conditions

Planned malfunctions:
Unable to identify the VOR (simulated by deselecting or turning-down NAV audio)
VOR indicator off flag or missing deviation bar (simulated by changing NAV frequency)

Risks (real or simulated):
Navigation errors due to unreliable signals
Strong crosswinds forecast en route (being off course because of failure to apply appropriate wind corrections)
Unforecast convective weather en route
While en route, reported winds at the destination are 13 knots gusting to 19 knots 60° from the runway heading. A later PIREP from a Corvalis TT landing at your destination indicates wind shear with a loss of 10 knots on final

New this scenario:
VOR accuracy check
Navigation system orientation (VOR)
Navigation system course intercepting and tracking (VOR)
Victor airway intercepting and tracking

Improving your skills:
Risk management
Preflight preparation
Checklist usage
Recovery from unusual flight attitudes
SCENARIO 3: Flying Published Departure Procedures
*ATD MAY BE USED*

Note: Although an ATD may be used for this scenario, the maximum time that may be credited is 10 hours (BATD) or 20 hours (AATD) instrument time for a Part 61 course [61.65(i)] or 25% (BATD) or 40% (AATD) of the total instrument training requirement (35 hours) for a Part 141 course [141 Appendix C, 4.(b)(3)].

Objective:
Become familiar with and fly published departure procedures

Purpose/pressures (real or simulated):
You are flying to your class reunion to show friends your new airplane.

Where to go:
To a nearby airport that has a published departure procedure (if your home airport does not have one)

How to get there:
Published departure procedures, GPS or VOR navigation, vectors

Planned deviations:
As necessary to deal with malfunction

Planned malfunctions:
Rough running engine

Risks (real or simulated):
Compromised ability to meet the departure climb requirements

New this scenario:
Compliance with published departure procedures
Understanding required climb gradient

Improving your skills:
Preflight preparation
Instrument cockpit check
Compliance with ATC clearances
Basic instrument flight maneuvers
### Phase 3 Ground Training Checklist

*All items to be graded independently by the instructor and customer, then discussed and a final grade assessed.*

*Desired outcome for all tasks by the end of the phase is “Explain”*

**Phase 3 completion standards:**

You have completed Phase 3 when you

- Can determine if the navigation aid is suitable for IFR use
- Maintain situational awareness when using navigation aids
- Can accurately intercept and track navigation systems
- Correct for wind drift as needed to maintain on course
- Have reviewed the Phase Progress Report with your instructor

---

**INSTRUCTOR NOTES:**
PHASE 4: Holding Patterns and DME Arcs

Phase Objective: During this phase you will
- Be able to fly an appropriate entry into a holding pattern
- Understand the required reports associated with holding procedures
- Accurately fly a holding pattern
- Be able to fly a DME arc
- Successfully complete a Progress Check

Web-based KNOWLEDGE

HOLDING PATTERNS AND ARRIVALS
DME ARCS
APPROACH CHARTS

4.1 HOLDING PATTERNS AND ARRIVALS
Objective: You will understand holding patterns and arrivals to the terminal area.

4.1.1 Holding Patterns
The Holding Pattern
How to Fly a Holding Pattern
Holding Pattern Entries
Holding at Intersections and Waypoints
Flying Holding Patterns with the G1000

4.1.2 Arrivals
Format and Symbols on STAR Charts
Loading and Flying Arrival Procedures

4.2 DME ARCS
Objective: You will learn how to fly a DME arc.

4.2.1 Flying DME Arcs
DME Arcs Using VOR and DME
DME Arcs Using the G1000

4.3 APPROACH CHARTS
Objective: You will gain knowledge about approach segments and approach charts.

4.3.1 Approach Charts and Approach Segments
Approach Segments
Overview of Approach Charts
Approach Chart Design

4.3.2 Sections of the Approach Chart
Margin Identification
Pilot Briefing

Airport Sketch

FLIGHT SCENARIOS

FLYING A HOLDING PATTERN
DME ARCS AND NON-PUBLISHED HOLDING PATTERNS
*PROGRESS CHECK*

*Flight scenarios will be repeated as necessary to reach the desired proficiency*
**SCENARIO 1: Flying a Holding Pattern**

*ATD MAY BE USED*

Note: Although an ATD may be used for this scenario, the maximum time that may be credited is 10 hours (BATD) or 20 hours (AATD) instrument time for a Part 61 course [61.65(i)] or 25% (BATD) or 40% (AATD) of the total instrument training requirement (35 hours) for a Part 141 course [141 Appendix C, 4.(b)(3)].

**Objective:**
Build the skills necessary to copy holding instructions, determine and fly the recommended entry into a proper holding pattern, and make required reports.

**Purpose/pressures (real or simulated):**
You are flying a business associate to a meeting.

**Where to go:**
To a nearby airport

**How to get there:**
Vectors, VOR or GPS navigation

**Planned deviations:**
Holding due to weather

**Planned malfunctions:**
None

**Risks (real or simulated):**
Weather below minimums at destination
Navigational confusion in the hold

**New this scenario:**
Holding entries and procedures

**Improving your skills:**
Single-pilot resource management
Preflight preparation
Instrument cockpit check
Basic instrument flight maneuvers
Intercepting and tracking navigational systems
Compliance with departure procedures
Recovery from unusual flight attitudes
Loss of primary flight instrument
SCENARIO 2: DME Arcs and Non-published Holding Patterns

*ATD MAY BE USED*

Note: Although an ATD may be used for this scenario, the maximum time that may be credited is 10 hours (BATD) or 20 hours (AATD) instrument time for a Part 61 course [61.65(i)] or 25% (BATD) or 40% (AATD) of the total instrument training requirement (35 hours) for a Part 141 course [141 Appendix C, 4.(b)(3)].

Objective:
Learn how to fly a DME arc, and hold at a fix without a published holding pattern.

Purpose/pressures (real or simulated):
You are trying to impress a date by flying to dinner at a nearby town.

Where to go:
A fix around which you can simulate flying a DME arc on the way to a nearby airport

How to get there:
Flying a clearance, victor airways, or vectors

Planned deviations:
Unplanned hold

Planned malfunctions:
None

Risks (real or simulated):
Extra fuel consumption due to hold

New this scenario:
Intercepting and tracking DME arcs
Non-published holding procedures

Improving your skills:
Single-pilot resource management
Preflight preparation
Instrument cockpit check
Basic instrument flight maneuvers
Compliance with departure procedures
Stage 2, Phase 4: Holding Patterns and DME Arcs

**Phase 4 Ground Training Checklist**

*All items to be graded independently by the instructor and customer, then discussed and a final grade assessed.

*Desired outcome for all tasks by the end of the phase is “Explain”*

<td></td>
</tr>
</tbody>
</table>
**Phase 4 completion standards:**
You have completed Phase 4 when you
- Can perform all preparation required for an IFR flight
- Are able determine the proper entry to a holding pattern, make all required ATC reports, and appropriately fly the holding pattern
- Intercept and fly a DME arc
- Have passed the Progress Check
- Have reviewed the Phase Progress Report with your instructor

---

**INSTRUCTOR NOTES:**
SCENARIO 3: *Progress Check*

Objective:
Fly with a check instructor to ensure satisfactory course and skill level progress.

Purpose/pressures (real or simulated):
You would like to fly your airplane on business trips for your company. Your company’s risk manager requires you to pass an evaluation by the chief or assistant chief instructor at a local flight school.

Where to go:
A point within 30 minutes flight time that is in suitable airspace free from obstructions and dense traffic

How to get there:
ATC clearance, navigation systems, vectors

Planned deviations:
None

Planned malfunctions:
Rough running engine
Flight display/instrument failure

Risks (real or simulated):
Stress from being evaluated

Checking your knowledge and skills:
Single-pilot resource management
Preflight preparation
Instrument cockpit check
Basic instrument flight maneuvers
Intercepting and tracking navigational systems
Intercepting and tracking DME arcs
Holding procedures
Compliance with departure procedures
Recovery from unusual flight attitudes
Loss of primary flight instrument

</table>

### Phase 4 *Progress Check* completion standards:

You have completed the Phase 4 *Progress Check* when you
- Perform and understand all preparation necessary for IFR flight
- Perform to the specified standards
- Demonstrate to the check instructor that the safety of flight is never in doubt
Stage 2, Phase 4: Holding Patterns and DME Arcs

INSTRUCTOR NOTES:
Stage 3 consists of two Phases
- Precision and Nonprecision Instrument Approaches
- Automation, ATC and Other Approaches

Stage Objective: During this stage you will
- Understand the elements of precision and nonprecision approaches
- Utilize appropriate, current approach procedure charts
- Learn how to brief, fly, and communicate with ATC during an instrument approach
- Know how to determine a missed approach point
- Be able to make a decision whether to continue for a landing or initiate missed approach procedures when arriving at the missed approach point
- Safely control the airplane using proper instrument cross-check and interpretation
- Discover how to perform a circling maneuver from an approach that does not place you in position for a straight-in to the landing runway
- Know items that you are required to report to ATC
- Fly precision and nonprecision approaches utilizing single-pilot resource management
- Fly with a check instructor to check your course progress

Each phase contains Web-based Knowledge Instruction
- The web-based knowledge instruction for the phase should be completed prior to starting the flight scenarios to ensure fundamental knowledge before the flight.

Each phase contains multiple Flight Scenarios that can be
- Customized for your local training environment
- Repeated, or
- Omitted if all items in the Phase Proficiency Checklist are completed to standard.

At the end of each Phase are the Ground Training Checklist and Phase Proficiency Checklist
- All items in the checklist must be completed to the appropriate standard listed before the Phase is considered complete.
PHASE 5: Precision and Nonprecision Instrument Approaches

Phase Objective: During this phase you will
- Fly precision and nonprecision approaches
- Land from a straight-in approach
- Learn the required visual references for making the appropriate decision to land or follow the missed approach procedure

Web-based KNOWLEDGE

IFR RULES AND APPROACH TYPES
- ILS APPROACHES
- LOCALIZER APPROACHES
- RNAV APPROACHES

5.1 IFR RULES AND APPROACH TYPES
Objective: You will learn more about instrument flight rules and the types of approaches.

5.1.1 Instrument Flight Rules
- Pilot and Airplane IFR Requirements
- Maintaining Your IFR Skills
- Continuing Beyond the Missed Approach Point

5.1.2 Instrument Approach Types
- Precision Approaches and APVs
- Nonprecision Approaches

5.1.3 Course Reversals
- Getting Turned Around to Make an Approach

5.1.4 Localizer Courses
- How to Fly Localizer Courses

5.2 ILS APPROACHES
Objective: You will gain knowledge about the Instrument Landing System (ILS).

5.2.1 Instrument Landing System (ILS) Components
- Guidance
- Range
- Visual Components
- Runway Visual Range (RVR)
- Inoperative ILS Components

5.2.2 How to Fly an ILS
- Choosing Which Approach to Fly
- Self-Briefing the Approach
- Setting Up for the Approach
- Flying the ILS
- Flying the Missed Approach

5.3 LOCALIZER APPROACHES
Objective: You will discover how to use the localizer front and back courses.

5.3.1 Localizer Approaches
- Flying a Localizer Front Course
- Flying a Localizer Back Course
- Flying SDF and LDA Approaches
- Flying DME Arcs to a Localizer
5.4 RNAV APPROACHES

Objective: You will gain insight on the different types of RNAV approaches.

5.4.1 RNAV Approaches
RNAV Approaches

5.4.2 RNAV (GPS) Approach Types
LPV and LP Approaches
LNAV/VNAV Approach
LNAV Approach
GPS and Missed Approaches

FLIGHT SCENARIOS

ILS APPROACHES
RNAV (GPS) APPROACHES WITH VERTICAL GUIDANCE (WAAS)
RNAV (GPS) APPROACHES WITHOUT VERTICAL GUIDANCE
LOCALIZER (LOC) APPROACHES

*Flight scenarios will be repeated as necessary to reach the desired proficiency*
**SCENARIO 1: ILS Approaches**

*ATD MAY BE USED*

Note: Although an ATD may be used for this scenario, the maximum time that may be credited is 10 hours (BATD) or 20 hours (AATD) instrument time for a Part 61 course [61.65(i)] or 25% (BATD) or 40% (AATD) of the total instrument training requirement (35 hours) for a Part 141 course [141 Appendix C, 4.(b)(3)].

**Objective:**
Learn how to fly a precision approach, using vertical and lateral guidance to descend to the decision altitude / decision height and decide whether to make a missed approach or continue below the approach minimums visually.

**Purpose/pressures (real or simulated):**
You are making a flight with two friends to a nearby airport for an FAA Safety Seminar.

**Where to go:**
An airport within 30 minutes flight time that has a suitable ILS approach.

**How to get there:**
Vectors or assigned route using navigation systems.

**Planned deviations:**
As necessary if the airport environment is not in sight at the decision height.

**Planned malfunctions:**
None.

**Risks (real or simulated):**
AIRMET Sierra valid, visibility is expected to be 2 miles in haze with ceilings at 700 feet upon the time of your planned arrival (possibility of encountering IMC or mountain obscurations).

Distraction in the cockpit.

**New this scenario:**
Communication with ATC.
Approach briefing.
Vectors to final approach course.
Precision approach.
- Intercept and track localizer course.
- Intercept and track the glide slope.
- Execute missed approach procedure.
- Transition to landing from an approach.

**Improving your skills:**
Checklist usage.
Intercepting and tracking navigational systems.
SCENARIO 2: RNAV (GPS) Approaches With Vertical Guidance (WAAS)
*ATD MAY BE USED*

Note: Although an ATD may be used for this scenario, the maximum time that may be credited is 10 hours (BATD) or 20 hours (AATD) instrument time for a Part 61 course [61.65(i)] or 25% (BATD) or 40% (AATD) of the total instrument training requirement (35 hours) for a Part 141 course [141 Appendix C, 4.(b)(3)].

Objective:
Learn how to fly an RNAV (GPS) approach with vertical guidance to the decision altitude and decide whether to make a missed approach or continue below the approach minimums visually.

Purpose/pressures (real or simulated):
You are making an instrument proficiency flight into a nearby major airline airport that will also allow you to pick up your college roommate and spouse. A presidential temporary flight restriction (TFR) has just been moved up to start 45 minutes after your friends’ scheduled arrival.

Where to go:
An airport within 30 minutes flight time that has a suitable RNAV (GPS) WAAS approach listing LPV and/or LNAV/VNAV minima.

How to get there:
Vectors or assigned route using navigation systems

Planned deviations:
To suitable airport to deal with failures
As necessary if the airport environment is not in sight at the decision altitude

Planned malfunctions:
Alternator failure

Risks (real or simulated):
Hurried actions because of the TFR
Wake turbulence
According to the forecast, you expect ceilings 200 feet above the applicable RNAV approach decision altitude with the visibility 3/4 mile greater than the published minimum upon arrival.

New this scenario:
Load and verify RNAV approach into navigation system
RNAV approach with vertical guidance
- Intercept and track RNAV approach course
- Intercept and track electronic vertical guidance

Improving your skills:
Communication with ATC
Compliance with ATC clearance
Approach briefing
Checklist usage
Intercepting and tracking navigational systems
Execute missed approach procedure
Transition to landing from an approach
SCENARIO 3: RNAV (GPS) Approaches Without Vertical Guidance
*ATD MAY BE USED*

Note: Although an ATD may be used for this scenario, the maximum time that may be credited is 10 hours (BATD) or 20 hours (AATD) instrument time for a Part 61 course [61.65(i)] or 25% (BATD) or 40% (AATD) of the total instrument training requirement (35 hours) for a Part 141 course [141 Appendix C, 4.(b)(3)].

Objective:
Learn how to fly an RNAV (GPS) nonprecision approach to the minimum descent altitude (MDA) and missed approach point, and decide whether to make a missed approach or continue below the approach minimums visually.

Purpose/pressures (real or simulated):
You have just discovered a reliability issue with your highest revenue product and are flying to a nearby airport to meet with your vendor and engineers from their out-of-area supplier of the suspect component. The engineers depart on an international flight this evening.

Where to go:
An airport within 30 minutes flight time that has a suitable RNAV (GPS) straight-in approach.

How to get there:
Vectors or assigned route using navigation systems

Planned deviations:
As necessary for RAIM not available
As necessary if the airport environment is not in sight at the MDA

Planned malfunctions:
RAIM unavailable

Risks (real or simulated):
Distraction because of focus on product issue
Forecast conditions have been slowly deteriorating, but you expect ceilings 300 feet above the applicable RNAV approach MDA with the visibility 1 mile greater than the published minimum upon arrival.

New this scenario:
Terminal Arrival Area (TAA) procedure or course reversal
RNAV Approach without vertical guidance
  Descend to the minimum descent altitude (MDA)
  Identify the missed approach point

Improving your skills:
Communication with ATC
Compliance with ATC clearance
Approach briefing
Checklist usage
Intercepting and tracking navigational systems
Load and verify RNAV approach into navigation system
Execute missed approach procedure
Transition to landing from an approach
SCENARIO 4: Localizer (LOC) Approaches
*ATD MAY BE USED*

Note: Although an ATD may be used for this scenario, the maximum time that may be credited is 10 hours (BATD) or 20 hours (AATD) instrument time for a Part 61 course [61.65(i)] or 25% (BATD) or 40% (AATD) of the total instrument training requirement (35 hours) for a Part 141 course [141 Appendix C, 4.(b)(3)].

Objective:
Learn how to fly a localizer nonprecision approach to the minimum descent altitude and missed approach point and decide whether to make a missed approach or continue below the approach minimums visually.

Purpose/pressures (real or simulated):
You are fulfilling a promise to take a good friend to dinner at a well-known restaurant within walking distance from the airport in a neighboring city.

Where to go:
An airport within 30 minutes flight time with a suitable LOC, LDA, or SDF straight-in-approach

How to get there:
Vectors or assigned route using navigation systems

Planned deviations:
As necessary to deal with radio failure
As necessary if the airport environment is not in sight at the MDA

Planned malfunctions:
Number 1 com radio failure (Number 2 works fine)

Risks (real or simulated):
A coastal marine cloud layer has covered the destination area with ceilings 150 feet above the MDA and is forecast to remain the same and is forecasted to remain the same throughout the evening. Visibility is greater than 6 miles.

New this scenario:
Localizer approach
  Identify missed approach point using time from final approach fix
  Descend from MDA at visual descent point (VDP)

Improving your skills:
Communication with ATC
Compliance with ATC clearance
Approach briefing
Checklist usage
Intercepting and tracking navigational systems
Descend to the minimum descent altitude (MDA)
Identify the missed approach point
Execute missed approach procedure
Transition to landing from an approach
## Phase 5 Ground Training Checklist

*All items to be graded independently by the instructor and customer, then discussed and a final grade assessed.

*Desired outcome for all tasks by the end of the phase is “Explain”*

**Phase 5 completion standards:**

You have completed Phase 5 when you

- Consistently and safely control the airplane in all phases of an instrument approach
- Recognize when a missed approach is required and safely initiate missed approach procedures
- Have reviewed the Phase Progress Report with your instructor
Stage 3, Phase 5: Precision and Nonprecision Instrument Approaches

INSTRUCTOR NOTES:
PHASE 6: Automation, ATC, and Other Approaches

Phase Objective: During this phase you will
- Polish precision and nonprecision instrument approach procedures
- Discover use of the autopilot for instrument approaches
- Learn about using a circling maneuver to align with the landing runway
- Land from both straight-in and circling approaches
- Complete a progress check to ensure you can safely fly instrument approaches

Web-based KNOWLEDGE

INCORPORATING AUTOMATION
VOR AND NDB APPROACHES
ATC CLEARANCES, SERVICES, AND MORE APPROACHES
ATC PROCEDURES

6.1 INCORPORATING AUTOMATION
Objective: You will learn how automatic flight control systems work and how to use the one in your airplane to manage risk.

6.1.1 Automatic Flight Control System (AFCS)
- How an Automatic Flight Control System (AFCS) Works
- Using an Automatic Flight Control System (AFCS)

6.2 VOR AND NDB APPROACHES
Objective: You will learn about VOR and NDB approach procedures.

6.2.1 VOR Approaches
- VOR Approach

6.2.2 Flying the NDB Approach
- NDB Approach

6.3 ATC CLEARANCES, SERVICES, AND MORE APPROACHES
Objective: You will know your responsibilities when operating under an IFR clearance and techniques for flying circle-to-land, contact and visual approaches.

6.3.1 Clearances, Procedures, and Responsibilities
- Clearances
- IFR Clearances That Include VFR Conditions
- Radar Services in the Terminal Area
- Aeronautical Information Manual (AIM)

6.3.2 Circling, Contact, and Visual Approaches
- Circling Approaches
- Contact and Visual Approaches

6.4 ATC PROCEDURES
Objective: You will know what to do in the case of a communications failure.

6.4.1 ATC Procedures
- Increasing Traffic Flow
- Communications Failure
- Complete Radio Failure
Stage 3, Phase 6: Automation, ATC and Other Approaches

FLIGHT SCENARIOS

VOR/NDB APPROACHES
CIRCLING APPROACHES
MORE ILS AND NONPRECISION APPROACHES

*PROGRESS CHECK*

*Flight scenarios will be repeated as necessary to reach the desired proficiency*
SCENARIO 1: VOR/NDB Approaches
*ATD MAY BE USED*

Note: Although an ATD may be used for this scenario, the maximum time that may be credited is 10 hours (BATD) or 20 hours (AATD) instrument time for a Part 61 course [61.65(i)] or 25% (BATD) or 40% (AATD) of the total instrument training requirement (35 hours) for a Part 141 course [141 Appendix C, 4.(b)(3)].

Objective:
Learn how to fly a VOR nonprecision approach to the minimum descent altitude and missed approach point and decide whether to make a missed approach or continue below the approach minimums. If your airplane has a functioning ADF and there is a NDB approach available, you will also fly a nonprecision NDB approach.

Purpose/pressures (real or simulated):
You are making an after-work flight to a nearby airport to participate in a seminar on technically advanced aircraft.

Where to go:
An airport within 30 minutes flight time that has a suitable VOR approach and an airport with a suitable NDB approach if the airplane is ADF equipped.

How to get there:
Vectors or assigned route using navigation systems

Planned deviations:
As appropriate to deal with communication failure
As necessary if the airport environment is not in sight at the missed approach point

Planned malfunctions:
Loss of all communication radios during radar vectors for the approach

Risks (real or simulated):
Terrain rises over 3,000 feet above the destination airport elevation within 18 miles.
The only published approaches at the destination airport are nonprecision using ground-based navaids.
The forecast calls for ceilings at 400 feet above the VOR/NDB approach MDA and a visibility of 1 mile greater than the lowest approach minimums.

New this scenario:
VOR/NDB approach
Loss of communications

Improving your skills:
Communication with ATC
Compliance with ATC clearance
Approach briefing
Checklist usage
TAA or course reversal
Descend to the minimum descent altitude (MDA)
Identify the missed approach point
Execute missed approach procedure
Transition to landing from a straight-in approach
SCENARIO 2: Circling Approaches

Objective:
Fly a circling approach to the minimum descent altitude, initiate a circle-to-land maneuver as appropriate for your category of aircraft, and land on the appropriate runway.

Purpose/pressures (real or simulated):
You are flying to a nearby airport to look at an airplane for sale.

Where to go:
An airport within 30 minutes flight time that has a suitable nonprecision approach including the authorized circling procedures

How to get there:
Vectors or assigned route using navigation systems

Planned deviations:
As necessary if the airport environment is not in sight at the missed approach point or is lost during the circling maneuver

Planned malfunctions:
RAIM failure

Risks (real or simulated):
The destination airport has only one published instrument approach but multiple runways
The current and forecast winds make a 12 knot crosswind component with the straight-in runway
Forecast ceiling is no greater than 150 feet above the applicable circling MDA and visibility no greater than ¾ mile more than applicable minimum (not having the airport environment in sight at the missed approach point or losing sight of the runway while circling)

New this scenario:
Circling approach
- Determine circling approach minima
- Select and fly circling maneuver
- Execute missed approach during circling approach
- Transition to landing from a circling approach

Improving your skills:
Communication with ATC
Compliance with ATC clearance
Approach briefing
Checklist usage
TAA or course reversal
Descend to the minimum descent altitude (MDA)
Identify the missed approach point
SCENARIO 3: More ILS and Nonprecision Approaches
*ATD MAY BE USED*

Note: Although an ATD may be used for this scenario, the maximum time that may be credited is 10 hours (BATD) or 20 hours (AATD) instrument time for a Part 61 course [61.65(i)] or 25% (BATD) or 40% (AATD) of the total instrument training requirement (35 hours) for a Part 141 course [141 Appendix C, 4.(b)(3)].

Objective:
Polish your ability to fly a precision instrument approach while incorporating departure and holding procedures.

Purpose/pressures (real or simulated):
You are flying to a business meeting that has been planned for a month.

Where to:
A nearby area with suitable ILS and nonprecision approaches at one or more airports

How to get there:
Vectors or assigned route using navigation systems utilizing a departure procedure at one airport

Planned deviations:
En route holding because of a weather delay at the destination
As necessary if the airport environment is not in sight at the missed approach point or is lost during the circling maneuver

Planned malfunctions:
Possible radio failure

Risks (real or simulated):
Low instrument conditions forecast for destination airport (ceiling no greater than 50 feet higher above the applicable minimum altitude and visibility no greater than ½ mile more than applicable minimums)
Reduced fuel reserve because of unexpected holding
The last pilot to fly the airplane noted intermittent static in the radios

Improving your skills:
Single-pilot resource management
Preflight preparation
Communication with ATC
Compliance with ATC clearance
Approach briefing
Checklist usage
Departure procedures
Holding procedures
TAA or course reversal
Precision approach
Nonprecision approach
Circling approach
Execute missed approach procedure
Landing from a straight-in or circling approach
Loss of communications
### Phase 6 Ground Training Checklist

*All items to be graded independently by the instructor and customer, then discussed and a final grade assessed.

**Desired outcome for all tasks by the end of the phase is “Explain”**

### Phase 6 completion standards:

You have completed Phase 6 when you

- Fully understand instrument approach procedures
- Fly precision and nonprecision instrument approaches to meet the airman certification standards
- Make required communications with ATC
- Understand procedures for loss of communications
- Maintain situational awareness during actual or simulated IMC flights
- Use the checklist throughout the flight and on the ground as necessary
- Make safety-conscious approach briefings
- Have reviewed the Phase Progress Report with your instructor

---

**INSTRUCTOR NOTES:**

---

57 Ver. 1.03
SCENARIO 4: *Progress Check*

**Objective:**
Fly with a check instructor to ensure you’re able to safely fly instrument approaches to meet the airman certification standards.

**Purpose/pressures (real or simulated):**
You are completing the flight portion of an interview and are flying with the chief pilot of the company you hope to work for.

**Where to go:**
A nearby area with suitable ILS and nonprecision approaches at one or more airports

**How to get there:**
Vectors or assigned route using navigation systems utilizing a departure procedure at one airport

**Planned deviations:**
None

**Planned malfunctions:**
Radio failure (not simultaneous with next malfunction)
Loss of navigation system (not simultaneous with previous malfunction)

**Risks (real or simulated):**
Stress from being evaluated

**Testing your skills and knowledge:**
Single-pilot resource management
Preflight preparation
Instrument cockpit check
Communication with ATC
Compliance with ATC clearances
Approach briefing
Checklist usage
Departure procedures
Holding procedures
TAA or course reversal
Precision approach
Nonprecision approach
Circling approach
Execute missed approach procedure
Landing from a straight-in or circling approach
Loss of communications
Stage 3, Phase 6: Automation, ATC and Other Approaches

### Phase 6 *Progress Check*- Oral

*Desired outcome for all tasks for the Progress Check is “Explain”*

<table>

*Refer to Instrument Rating Airman Certification Standards (FAA-S-ACS-8) in the course Library*
Phase 6 *Progress Check* completion standards:
You have completed the Phase 4 *Progress Check* when you
- Perform and understand all preparation necessary for IFR flight
- Can safely perform instrument approach procedures to meet the airman certification standards
- Apply single-pilot resource management
- Demonstrate to the check instructor that the safety of flight is never in doubt

INSTRUCTOR NOTES:
Stage 4 consists of two Phases

- IFR Cross Country
- Practical Test Preparation

Stage Objective: During this stage you will

- File an IFR flight plan and receive an IFR clearance
- Fly cross country on an instrument flight plan
- Complete FAA IFR cross-country requirements
- Safely control the airplane using proper instrument cross-check and interpretation
- Polish all instrument flying skills
- Review for the oral and flight portion of the practical test
- Fly with a check instructor to check your readiness for the FAA practical test

Each phase contains Web-based Knowledge Instruction

- The web-based knowledge instruction for the phase should be completed prior to starting the flight scenarios to ensure fundamental knowledge before the flight.

Each phase contains multiple Flight Scenarios that can be

- Customized for your local training environment
- Repeated, or
- Omitted if all items in the Phase Proficiency Checklist are completed to standard.

At the end of each Phase are the Ground Training Checklist and Phase Proficiency Checklist

- All items in the checklist must be completed to the appropriate standard listed before the Phase is considered complete.
PHASE 7: IFR Cross Country

Phase Objective: During this phase you will
- Safely plan and conduct IFR cross-country flights
- Meet the FAA requirements for cross-country training

Web-based KNOWLEDGE INSTRUCTION

PROCEDURES FOR FLYING CROSS-COUNTRY IFR
PLANNING YOUR CROSS-COUNTRY FLIGHT
SAFETY TIPS AND TOOLS

7.1 PROCEDURES FOR FLYING CROSS COUNTRY IFR
Objective: You will know how to fly cross-country under instrument flight rules.

7.1.1 Cross-Country IFR
- Radar Procedures and Services Enroute
- IFR Procedures and Reports

7.2 PLANNING YOUR CROSS-COUNTRY FLIGHT
Objective: You will discover the wealth of resources available to help you plan a safe IFR cross-country flight.

7.2.1 IFR Cross-Country Planning
- Chart Supplement
- Gathering Weather Information
- Preflight Planning
- IFR Flight Plan

7.3 SAFETY TIPS AND TOOLS
Objective: You will gain insight on how to enhance safety during ground, departure, and arrival phases of your IFR flight.

7.3.1 Tips and Tools
- Visual Illusions
- Aeromedical Factors and Oxygen Rules
- Avoiding Other Aircraft
- Arriving IFR at a Non-Towered Airport
- Flying Across Pressure and Temperature Changes
- Avoiding Special Hazards at Airports
- Visual Glideslope Indicators
- Airport Signs and Markings
- Flying in Icing Conditions
- Operating the Autopilot During IFR Flight

7.3.2 Risk Management
- Personal Minimums
- PAVE Checklist
- CARE Checklist
- Two Rules for Safe IFR Flying

FLIGHT SCENARIOS

FLYING AN IFR CROSS COUNTRY
APPROACH WITH LOSS OF PRIMARY FLIGHT INSTRUMENTS
LONG IFR CROSS COUNTRY

*Flight scenarios will be repeated as necessary to reach the desired proficiency*
SCENARIO 1: FLYING AN IFR CROSS COUNTRY

Objective:
Plan and fly an instrument cross-country flight to your destination airport.

Purpose/pressures (real or simulated):
You are flying for a second look at an airplane you are interested in buying. You are bringing along your friend who is an experienced IFR pilot and certificated airframe and powerplant mechanic.

Where to go:
An airport at least 50 nm straight-line distance

How to get there:
Route as assigned (or modified) in ATC clearance, using installed navigation equipment and vectors (if assigned)

Planned deviations:
Diversion to another destination because of weather

Planned malfunctions:
Communications failure, navigation equipment failure (on return leg)

Risks (real or simulated):
Approaching front at your destination airport with rain showers, low ceilings, low visibilities, and winds gusting to 20 knots.
Runway favored by the wind does not have a straight-in approach
Confusion in the cockpit as to who is the pilot-in-command

New this scenario:
Automation management
Cross-country planning procedures
Compliance with departure, en route, and arrival procedures
Required ATC reports
Autopilot use

Improving your skills:
Single-pilot resource management
Communication with ATC
Compliance with ATC clearances
Intercepting and tracking navigational systems
Precision approach
Nonprecision approach
Landing from a straight-in or circling approach
SCENARIO 2: Approach with Loss of Primary Flight Instruments (ATD)

*ATD MAY BE USED*

Note: Although an ATD may be used for this scenario, the maximum time that may be credited is 10 hours (BATD) or 20 hours (AATD) instrument time for a Part 61 course [61.65(i)] or 25% (BATD) or 40% (AATD) of the total instrument training requirement (35 hours) for a Part 141 course [141 Appendix C, 4.(b)(3)].

Objective:
Fly an instrument approach with failed primary flight instruments.

Purpose/pressures (real or simulated):
You are flying, with your significant other, to a nearby town to a business meeting with a prospective client and/or investor. After departure your significant other wants to immediately return because of motion sickness.

Where to go:
A nearby area where one or more airports have suitable precision and nonprecision instrument approaches

How to get there:
Vectors or assigned route using navigation systems

Planned deviations:
Need to return to departure airport because of a sick passenger

Planned malfunctions:
Loss of primary flight instruments

Risks (real or simulated):
Controlled flight into terrain
Loss of situational awareness
Pilot disorientation
Distractions in the cockpit

New this scenario:
Precision approach with the loss of primary flight instruments
Nonprecision approach with the loss of primary flight instruments

Improving your skills:
Task management
Situational awareness
Automation management
Communication with ATC
Compliance with ATC clearances
Required ATC reports
Intercepting and tracking navigational systems
Precision approach
Nonprecision approach
Landing from a straight-in or circling approach
SCENARIO 3: Long IFR Cross Country

Objective:
Fly a 250 nm distance along airways or ATC-directed routing, with one segment of the flight consisting of at least a straight-line distance of 100 nm between airports.

Purpose/pressures (real or simulated):
You have a freelance assignment to take photos of the top FBOs at three different airports. Your deadline is the day after the scheduled flight.

Where to go:
Three different airports with instrument approaches using three different navigation systems

How to get there:
Route as assigned (or modified) in ATC clearance, using installed navigation equipment and vectors (if assigned)

Planned deviations:
As required en route

Planned malfunctions:
Alternator failure during missed approach (simulated by using reversionary mode)

Risks (real or simulated):
Unforecast weather
Limited battery life
Possible no-flap landing (because of low battery power)

New this scenario:
Alternator failure in IMC
No-flap approach and landing

Improving your skills:
Single-pilot resource management
Automation management
Cross-country planning procedures
Compliance with departure, en route, and arrival procedures
Communication with ATC
Compliance with ATC clearances
Required ATC reports
Autopilot use
Intercepting and tracking navigational systems
Precision approach
Nonprecision approach
Landing from a straight-in or circling approach
Nonprecision approach with the loss of primary flight instruments
### Phase 7 Ground Training Checklist

FLIGHT SCENARIOS

POLISHING ALL IFR SKILLS

*FINAL PROGRESS CHECK*

*Flight scenarios will be repeated as necessary to reach the desired proficiency*
Stage 4, Phase 8: Practical Test Preparation

SCENARIO 1: Polishing All IFR Skills

Objective:
This is a review flight before the final progress check in order to polish all skills to the current Instrument Rating Airman Certification Standards.

Purpose/pressures (real or simulated):
This flight will be tailored to your individual needs and focused on areas requiring special assistance or review.

Where to go:
An area free of dense traffic having one or more airports with appropriate published instrument approach procedures

How to get there:
Vectors or assigned route using navigation systems

Planned deviations:
As assigned

Planned malfunctions:
As assigned

Risks (real or simulated):
As assigned

Improving your skills:
Special emphasis areas
- Positive aircraft control
- Positive exchange of the flight controls
- Stall/spin awareness
- Collision avoidance
- Wake turbulence avoidance
- Land and hold short operations (LAHSO)
- Runway incursion avoidance
- Checklist usage
- Icing conditions: operational hazards, and anti-icing and deicing equipment

Single-pilot resource management
- Aeronautical decision making
- Risk management
- Task management
- Situational awareness
- Controlled flight into terrain awareness
- Automation management

Preflight preparation
- Pilot qualifications
- Weather information
- Cross-country flight planning
- Preflight procedures
- Aircraft systems related to IFR operations
- Aircraft flight instruments and navigation equipment
- Instrument cockpit check

Air traffic control clearances and procedures
- ATC clearances
- Compliance with departure, en route, and arrival procedures and clearances
- Holding procedures

Flight by reference to instruments
- Basic instrument flight maneuvers
- Recovery from unusual flight attitudes

Navigation systems
- Intercepting and tracking navigation systems and DME arcs
SCENARIO 1: Polishing All IFR Skills continued

Instrument approach procedures
   Nonprecision approach
   Precision approach
   Missed approach
   Circling approach
   Landing from a straight-in or circling approach
Emergency operations
   Loss of communications
   Approach with loss of primary flight instrument indicators
Postflight procedures
   Note and document equipment and/or aircraft malfunctions
### Phase 8 Ground Training Checklist

*All items to be graded independently by the instructor and customer, then discussed and a final grade assessed.

Desired outcome for all tasks by the end of the phase is “Explain”

#### Preflight procedures

Preflight preparation

Refer to Instrument Rating Airman Certification Standards (FAA-S-ACS-8) in the course Library

Instrument cockpit check

Performs preflight on instruments, avionics, and navigation equipment

Checklist usage

Utilizes checklist during all ground and flight operations

#### In-flight

Communication with air traffic control and clearances

Is able to respond to and understand ATC calls and clearances and make required reports

Compliance with departure, en route, and arrival procedures and clearances

Follows clearances and assigned published procedures
Phase 8 Proficiency Checklist continued

| Holding procedures |  
|---------------------|---
| Refer to Instrument Rating Airman Certification Standards (FAA-S-ACS-8) in the course Library |

| Approach with loss of primary flight instrument indicators | Refer to Instrument Rating Airman Certification Standards (FAA-S-ACS-8) in the course Library |  

| Postflight procedures |  
|-----------------------|---
| Checking instrument and equipment | Notes all flight equipment for proper operation and documents malfunctions |  

**Phase 8 completion standards:**
You have completed Phase 8 when you

- Meet the standards outlined in the Instrument Rating Airman Certification Standards.
SCENARIO 2: *Final Progress Check*

**Objective:**
Complete the final progress check for the course.

**Purpose/pressures (real or simulated):**
- This flight will be conducted in accordance with the current Instrument Rating Airman Certification Standards and is considered a mock practical test.

**Where to go:**
As assigned

**How to get there:**
Vectors, ATC clearance

**Planned deviations:**
As assigned

**Planned malfunctions:**
As assigned

**Risks (real or simulated):**
As assigned

**Checking your skills and knowledge:**

Special emphasis areas
- Positive aircraft control
- Positive exchange of the flight controls
- Stall/spin awareness
- Collision avoidance
- Wake turbulence avoidance
- Land and hold short operations (LAHSO)
- Runway incursion avoidance
- Checklist usage
- Icing conditions: operational hazards, and anti-icing and deicing equipment

**Single-pilot resource management**

### Phase 8 *Progress Check* completion standards:

- Demonstrate the aeronautical knowledge and skill to safely perform at or above the airman certification standards and demonstrate sound decision-making.
- Have demonstrated your ability as an instrument rated pilot
INSTRUCTOR NOTES:
Cessna Instrument Rating Course Training Requirements

Requirements for enrollment
Prior to enrolling in the flight portion of the Instrument Rating course, the customer must
• Hold at least a Private Pilot certificate with
  o An airplane category, single engine land class rating

Ground training requirements
The customer must successfully complete
• All web-based knowledge instruction and flight previews
• All Ground Training Checklists
• All Progress Checks
• Cessna Pilot Center Final Exam

Flight training requirements
Prior to completing the Cessna Instrument Rating Course
• The applicable minimum hourly requirements must be met
• As well as the successful completion of all Phase Proficiency Checklists and Progress Checks

Requirements for graduation
To obtain a graduation certificate for the Instrument Rating course, the applicant must:
• Be able to read, speak, write and understand English
• Complete all ground training requirements
• Complete all flight training requirements
• Complete the FAA Instrument Rating-Airplane Knowledge Test

Minimum flight time requirements
The course is designed to meet the minimum hour requirements of
• 14 CFR Part 141, Appendix C
• 14 CFR Part 61 Subpart B

The minimum FAA hour requirements
• Vary depending upon your course of enrollment
• Are to be thought of as minimums only
  o The goal is to prepare you to be a competent, proficient instrument pilot

What you get at an FAA certificated flight school (under 14 CFR Part 141)
If you take a course with this syllabus under Part 141 of the Federal Aviation Regulations, you are assured that flight school has been approved by the FAA and is required to demonstrate and maintain
• Standardized flight operations, including Safety Procedures and Practices
• A structured training environment
• Detailed training records available for regular and unannounced FAA checks and inspection
• At least an 80% first attempt pass rate for certificate or rating applicants training under Part 141

Because of this level of structure and supervision, a Part 141 approved curriculum is authorized to graduate qualified applicants in fewer flight hours.

* Based on a 45 second average per each lesson page and question.

** Based on 0.5 hour average total pre-flight and post-briefing per flight.

This syllabus accommodates the required 30-hour minimum aeronautical knowledge training when used as a Part 141, Appendix C curriculum as shown in the table above.

The aeronautical knowledge training occurs through multiple paths including online tested self study, viewing the online flight-preparatory video segments, and instructor/customer interaction in the pre- and post-flight briefings. Instruction will also be given during the instructor/customer Ground Training Checklist reviews.

A customer receives credit for the online course study when they complete every lesson within the course. To complete a lesson, the customer must satisfactorily complete every question within that lesson.

Customer aeronautical knowledge competence is assured through instructor/customer Ground Training Checklist reviews that must be demonstrated to the Explain level and the Cessna Pilot Center (CPC) knowledge test.
**Appendix A**

**Instrument Rating Course, Part 141**

- **Instrument Training Time**
  - 35 hours

**Approved Full Flight Simulator Time**
- Not to exceed 50%

**Approved Flight Training Device or Advanced Aviation Training Device Time**
- Not to exceed 40%

**Approved Basic Aviation Training Device**
- Not to exceed 25%

**IFR Cross-Country**
- At least 250 nm total distance
- One segment at least 100 nm straight-line distance between airports
- Instrument approach at each airport
- 3 different kinds of approaches

**Instrument Rating Course, Part 61**

- **Total Instrument Time**
  - (Actual or Simulated)
  - 40 hours

**Logged Total Cross-Country Time**
- (Visual and Instrument)
  - 50 hours as PIC

**Full Flight Simulator or Flight Training Device (Part 142)**
- 30 hours

**Full Flight Simulator or Flight Training Device (Not Part 142)**
- 20 hours

**Approved Advanced Aviation Training Device**
- 20 hours

**Approved Basic Aviation Training Device**
- 10 hours

**Instrument Flight Training**
- (Instrument-Airplane Instructor)
  - 15 hours

**IFR Cross-Country**
- 250 nm total distance
- Instrument approach at each airport
- 3 different kinds of approaches

**Instrument Flight Training**
- 3 hours within 2 calendar months before practical test

A3

Ver. 1.02
Appendix A

RECOMMENDED FLIGHT TIMES

- All times listed are the minimum requirements for that flight training category. The 50 hours of Cross-Country PIC time for a Part 61 curriculum must be met prior to the practical test.
- Flight Training (often called “dual”) means time spent receiving flight instruction from an authorized instructor.
- By equaling or exceeding the times in each category listed in the following tables, you are assured that you have met the minimum flight time requirements for your course.
- Since Cessna 172 Skyhawks may be equipped with either analog (“round dial”) flight instruments or the G1000 advanced avionics system, some scenarios are designated as specific to the instrument platform. When appropriate, there are parallel scenarios with the same objective, but tailored for the platform (G1000 or Analog). Only of one of each set of parallel scenarios are intended to be flown. Shading denotes parallel scenarios.
- Some scenarios are designated such that they may be flown on an Aviation Training Device (ATD). Instrument training or flight time performed on an ATD, a flight simulator, or a Flight Training Device (FTD) that exceeds the restrictions permitted for either Part 141 or Part 61 curriculum will not apply to the total instrument training/time requirements.

PAVE Checklist

PAVE your way to a safe instrument flight. Before you fly, examine your risk factors.

Remember the cumulative effect. Change your plan whenever more than one risk factor is marginal.

Pilot
Aircraft
enVironment
External Pressures

PILOT
Make a frank assessment of your own skills.

- Am I proficient (not just current) for flying in today’s weather?
- Do I have recent experience in actual instrument conditions?
- Am I proficient with the avionics and the navigation systems for this flight?
- Am I rested and have I checked the IMSAFE elements?

AIRCRAFT
Evaluate the capability of the aircraft.

- Does this airplane have enough redundancy of communication radios, navigation equipment, and flight instruments or display?
- Is the lighting working and good enough for night instrument flying?
- Does this airplane have sufficient performance reserve for this flight?
- Is there enough range reserve to reach a legal and safe alternate?

ENVIRONMENT
Evaluate the environmental factors at the airport and on the runway.

- Are conditions at my destination forecast for marginal IFR?
- Are there areas for a good weather alternate within my fuel range?
- What is the crosswind component on the active runway?
- Is the runway slick from water, snow, or slush?
- Are braking action reports available?

External Pressures
Evaluate pressures that influence you to make or complete the flight.

- Do someone else’s plans depend on you completing this flight?
- Are peers encouraging you to take off or land despite the conditions?
- What are your strategies for managing the external pressures specific to this flight?
Appendix B

CARE Checklist

Use the CARE attention scan to recognize and manage the changing risk factors in flight and for landing.

Manage your workload so that you have time to use the CARE checklist to deal with changes.

Consequences
Alternatives
Reality
External Pressures

Consequences

☐ Am I thinking: What is changing at my destination and alternate?
☐ Am I evaluating the consequences of changes I am seeing?
☐ Am I prepared for a later arrival, lower ceilings and visibility, gusts, or crosswind component more than I anticipated?
☐ Is moisture on the runway, and will temperature be a factor?

Alternatives

☐ Do I have more than one alternate course of action?
☐ Are conditions changing at my destination?
☐ Should I land now to expand my circle of alternatives and remove pressure to land in adverse conditions?

Reality

☐ Have I accepted the fact that the weather at my destination airport has changed?
☐ Has the goal to land at my destination put me in denial?
☐ Am I dealing with things as they really are enroute and at my destination, or just as I planned them?

External Pressures

☐ Am I ignoring risk factors in order to land at my destination?
☐ Am I managing my own goal-oriented behavior?
☐ Are pressures influencing me to continue under unsuitable conditions?
